Acknowledgments

I would like to express my sincere appreciation to the following individuals who have played a significant role in the completion of my research and the writing of this thesis.

First, I extend my deepest gratitude to Murata Sensei, for his continuous support throughout my academic journey, guidance, and endless afternoons over tea and sweets. His expertise, encouragement, and valuable insights have shaped my research. I am grateful for his dedication to my growth as a researcher and his belief in my potential since our first online meeting on Christmas Day, 2014.

I am grateful to the laboratory members for their collaboration, assistance, and stimulating discussions. Especially, to Riho Kondo and Yuiko Inoue, whose dedication has greatly contributed to the success of this research. I am grateful for their willingness and support in the fieldwork observations, even during holidays, for being patient and sharing their perspective.

I am deeply grateful to my parents and my family in Mexico for their encouragement throughout my academic journey, especially for being there any time from the other side of the world. They have been my pillars of strength, providing me with constant support and their unconditional love has been the driving force behind my academic achievements.

Lastly, I would like to extend my heartfelt thanks to my loving spouse, whose support, understanding, and patience have been invaluable throughout this journey. His cooking, encouragement, and belief in my potential have been a constant source of motivation and inspiration.

To everyone mentioned above and those who have contributed in various ways, thank you for being a part of this journey.

Sincerely,

Luciene Yeziret Espejo Blásquez

Thesis Abstract

This research examines the streetscape and pedestrian activities for a short time from an empirical approach, which could lead to significant Urban Attributes of Tokyo's commercial streets in a human-centered design. The study conducted fieldwork observations in the selected streets used as a place to stay in Ura-Harajuku, Shimokitazawa, and Omotesando, where Ephemeral Public Space, Temporary Edge, and Street Surface are the target areas, respectively. Lastly, the Specific Urban Attributes observed in Tokyo's commercial streets are described by enlightening the interactions of coined terms of General Urban Attributes. These findings would contribute to the quality of pedestrian-centered public spaces, where buildings, people, and public spaces converge at Eye Level.

1.1 Background and Purpose

1.1.1 Street as a Place to stay

The urban environment is formed of several fundamental components, including buildings, streets, transportation systems, and public spaces, which collectively generate a unique environment in every city. Tokyo, a polycentric urban metropolis, differs from Western metropolises in the lack of a central public square or plaza in daily urban life. Nevertheless, Tokyo remains an intimate and livable city through its diverse commercial districts and public spaces. These areas are situated between private spaces, such as homes and workplaces,¹⁾ including streets, plazas, and some internal spaces that may serve as both places to move and linger.

Strictly speaking, any space that is openly accessible could be classified as a public space, which may include streets. Streets can take on various forms, from boulevards and avenues to side streets, back streets, and alleyways, each capable of supporting outdoor life in different ways²⁾. Throughout history, streets served as an integrated system for both movement and social-economic activities until the mid-20th century. However, this changed during the 1970s when significant urban interventions prioritized vehicular traffic over pedestrian experience³⁾. Despite this shift, streets designed primarily for traffic flow may still maintain important significance as places for people.

In the context of Japanese streets, Ashihara⁴⁾ elaborates on the chaotic nature of Tokyo as a disorderly city, ugly, crowded, and congested but organically sprawling widely in every direction. Therefore, Tokyo is a city constantly in change, but also the ambiguity of boundaries could be the cause that leads to a lively atmosphere with changes over time. The building transformation is a continuous process influenced by redevelopment, short building lifespans, and land divisions, resulting in ever-changing streets. Unlike some Western city centers that aim to preserve buildings, Japan's cultural norms allow for tearing buildings down with no fear or nostalgia, resulting in a dynamic atmosphere⁵⁾.

Moreover, compared to buildings, the Japanese streets could represent the most enduring and immutable spatial component that serves different purposes. It not only facilitates traffic but also could be an attractive space for access, passage, and potentially, a place to stay.

The physical characteristics that shape districts are the continuities of an endless variety of components: texture, space, form, building type, use, activity, etcetera⁶⁾. In addition, in the context of the livability of urban everyday life, the walkability of a street cannot be solely attributed to the physical or appearance characteristics but

also requires the study of the attributes that could strengthen the human experience at Eye Level. The examination of cities at Eye Level^{7), 8)} emphasizes the human-scale analysis, particularly the ground floor of buildings and public spaces in the pedestrian experience. Many entities have been working towards achieving a better balance between pedestrians and cars and the awareness of creating healthy and happy cities has become extremely important. Especially the experiences of our surroundings in everyday life with public spaces that encourage people to walk and stay, even for only a short time. In this context, previous studies have demonstrated that solutions for the urban environment must be contextual and systematic.

For this reason, this research would identify the composite characteristics at Eye Level that may define contemporary streets as public spaces in Tokyo. By incorporating the analysis at Eye Level of pedestrians staying on the streets for a short time in the examination of chaos in Tokyo, hidden characteristics of Tokyo may emerge. These dynamic characteristics would offer an alternative perspective on the perceived “chaos,” highlighting the coexistence of multiple dynamic and static factors. By identifying these characteristics, the study seeks to provide specific potential strategies for future considerations in the human-centered design of public spaces.

1.1.2 Urban Attributes Framework

In this research, the characteristics that could improve the urban experience at Eye Level focus on aspects related to livability and walkability, will be referred to as Urban Attributes (UA). The analysis of independent factors with a deeper understanding of the composite characteristics of streets as places to stay could be developed. Some key factors that could contribute to this understanding at Eye Level include the role of **society**, including pedestrians as the main actors in the street, the utilization of **space** in conjunction with **time**, and the accentuation of local particularities⁹⁾ by using the street as a place to stay.

Fig. 1-1 presents a hypothetical overview of the framework employed in the study of UA for this research. Characteristics that may be crucial for improving the human experience at Eye Level are referred to as General Urban Attributes (GUA), as they may have been standardized from worldwide observations. Through some case studies analysis in Tokyo, new specific characteristics may arise, denominated as Specific Urban Attributes (SUA), that could reveal additional insights into a human-centered design approach.

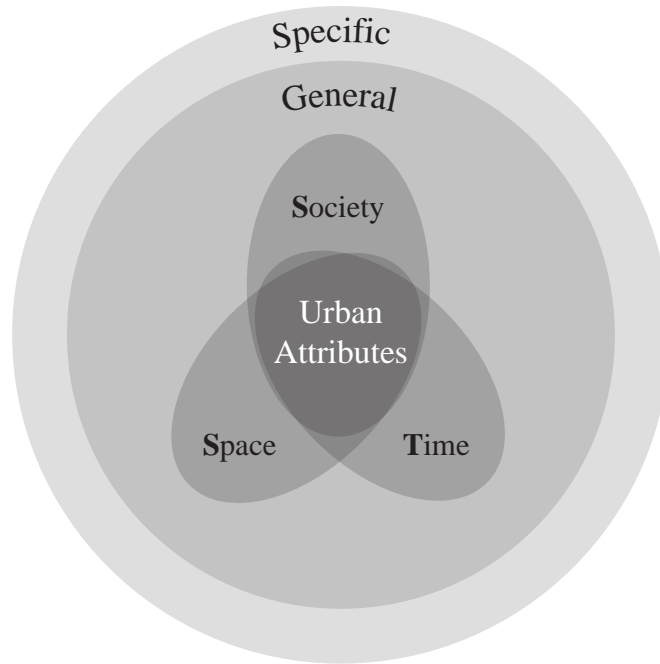

Fig.1-1 Urban Attributes overall framework
 Source: Author's interpretation

Therefore, elaborating on the evolution of these Urban Attributes, the coined term GUA will be further studied at the end of this Chapter, while SUA will be described in Chapter 5, as the discussion of Chapters 2, 3, and 4.

1.1.3 General Urban Attributes

Scholars worldwide have drawn attention to the significance of public urban life at Eye Level, with several researchers in the field identifying the dynamics of urban environments. For instance, Jacobs⁹⁾ found out through observation that cities are a dynamic process of a mixture of buildings that decay and regenerate over time. Furthermore, the way people use cities in real life is part of an organized complexity problem that requires attention to detailed views, similar to the approach taken in life sciences. Additionally, based on the understanding of the precedent studies, the following could be observed as substantial features of the General Urban Attributes.

Community: The human need for social interaction is a fundamental aspect of public urban life. Gehl¹⁰⁾, in his observations of public spaces, has identified social activities that range from superficial relations to passive contacts, as well as brief interactions with others. Such social activities are important contributors to a lively public space. Alexander¹¹⁾ builds on this idea by identifying spots in a community where actions seem to concentrate, which he refers to as “activity nodes.” The convergence of individuals

in these activity nodes results in the formation of temporary communities, where individuals who share the same space or activities come together to form a collective whole. (Fig. 1-2)

Friendly fronts: One aspect of walkability¹²⁾ that is often overlooked is the emphasis on statistical building measures in building codes, which fails to account for the importance of creating friendly fronts that contribute to the pedestrian experience. Similarly, Zukin¹³⁾ argues that the soul of a city is defined by the repetition of small stores that characterize its neighborhoods. This everyday experience, resulting from the continuous process of living or working in the same area, gives life to the sidewalk, pathway, or street.

Openness: Building facades play an important role in shaping the pedestrian experience. As the first point of contact, the facade's design can significantly impact a person's perception of the inside. Gehl¹⁴⁾ argues that ground-floor facades that are too closed off can result in a lack of vitality in the city, particularly if they feature monotonous edges that make for a tedious walking experience. On the other hand, an open facade that allows for interaction can create a sense of invitation or extension, enhancing the pedestrian experience. (Fig. 1-3)

Proximity: The more accessible a place or an object is, the easiest to approach. According to Sim²⁾, smaller spaces are more conducive to social interaction and closer engagement with surroundings, thereby intensifying encounters and experiences. This topic is further explored by Venturi¹⁵⁾, who coined the concept of the "architecture of persuasion," wherein words and symbols are used as communication through proximity and designed to be read by automobiles as they approach. This approach is commonly utilized in the commercial context, as it encourages customers to engage with storefronts and other commercial establishments. (Fig. 1-4)

Seating places: In public spaces, seating areas are often a recurring feature. Gehl¹⁰⁾ insists that well-defined spots with back support and sheltered surroundings are preferred to less clearly defined and open areas. For example, benches placed in the middle of open spaces are less inviting than those located in sheltered areas (Fig. 1-5). Additionally, facade elements, such as columns, planters or steps, can also serve as attractive seating areas.

Fig.1-2 Activity Nodes
 Source: *A pattern language* (Alexander, 1977)

A 2003 study of Copenhagen shopping streets shows that the activity level in front of active façade is seven times greater than in front of passive façades.¹¹

Fig.1-5 Preferred seating areas
Source: *Life between buildings* (Gehl, 2011)

In the case of Tokyo, a polycentric city that has merged with several surrounding cities. The unique blend of building scales within streets and the arbitrary accommodation of small urban elements set it apart from other cities. As a result, various domestic and international authors have closely examined this metropolis, with a focus on its distinctive attributes. The following General Urban Attributes have provided an insight into the study of Tokyo's streetscape.

Building boundaries: Several authors have attempted to understand the behavior of building boundaries in Tokyo due to the apparent lack of defined edges in neighborhoods and streets. Maki¹⁶⁾ defines the external layers of streets as part of Tokyo streetscapes, insisting that street space is bounded not only by walls but other elements that serve as interfaces between buildings and the city. Ashihara¹⁷⁾, in the study of commercial streets, notes that Japanese shopping streets are full of perpendicular signboards and fixtures that define the skylines as primary and secondary profiles besides the building facade. Commercial neighborhoods in Japan are typically filled with advertisements in various directions competing for the attention of pedestrians. (Fig. 1-6)

Corporate-led redevelopments: In recent research, Almazan¹⁸⁾ argues that Tokyo's private enclaves are proliferating due to the government's efforts to provide more public spaces through new developments. However, this trend contributes to a growing sense of exclusivity, homogeneity, and privatization of public spaces, reflecting increasing social stratification. Although some of these developments are advertised as publicly accessible, they have limited opening hours and are strategically located to encourage consumption.

Spontaneity: Furthermore, Sand¹⁹⁾ mentions that in Japan, the space is made through activities due to the absence of large open plazas commonly found in the West. The term *Hiroba* not only refers to its literal meaning but also represents a political aspiration towards commonality, spontaneity, and the use of space freely, which can be expressed in different locations and moments as a new concept of public open space.

Impermanence: The fact that Japan is susceptible to natural disasters that can cause significant damage to wooden structures such as houses and temples is well-known worldwide. Consequently, Maki¹⁶⁾ states that Japanese culture has no genuine experience of ruins. As a result, these structures are considered impermanent and

meant to be easily rebuilt or restored, having a temporal urban attribute. To add to this topic, the book *Tokyo Metabolizing*²⁰⁾ explains how the short lifespan of buildings in Japan affects the townscape through the accumulation of individual structures to form different generations of houses.

1.1.4 General and Specific Urban Attributes

In the study of the urban environment, Urban Attributes must have the potential to produce lively spaces in the street experience at Eye Level that could adapt to diverse circumstances. This research attempts to investigate how the growth and resilience of these concepts can unveil the urban attributes within specific localities.

Therefore, Fig. 1-8 illustrates the factors previously identified in Chapter 1.1.2 as society, time, and space beside the nine selected GUAs for this research. Moreover, in unveiling the local specificities, through some case studies analysis, the SUA may contrast, advance, vary, or expand from the General Urban Attributes. This overlap could result in some strategies that significantly impact the street experience at Eye Level.

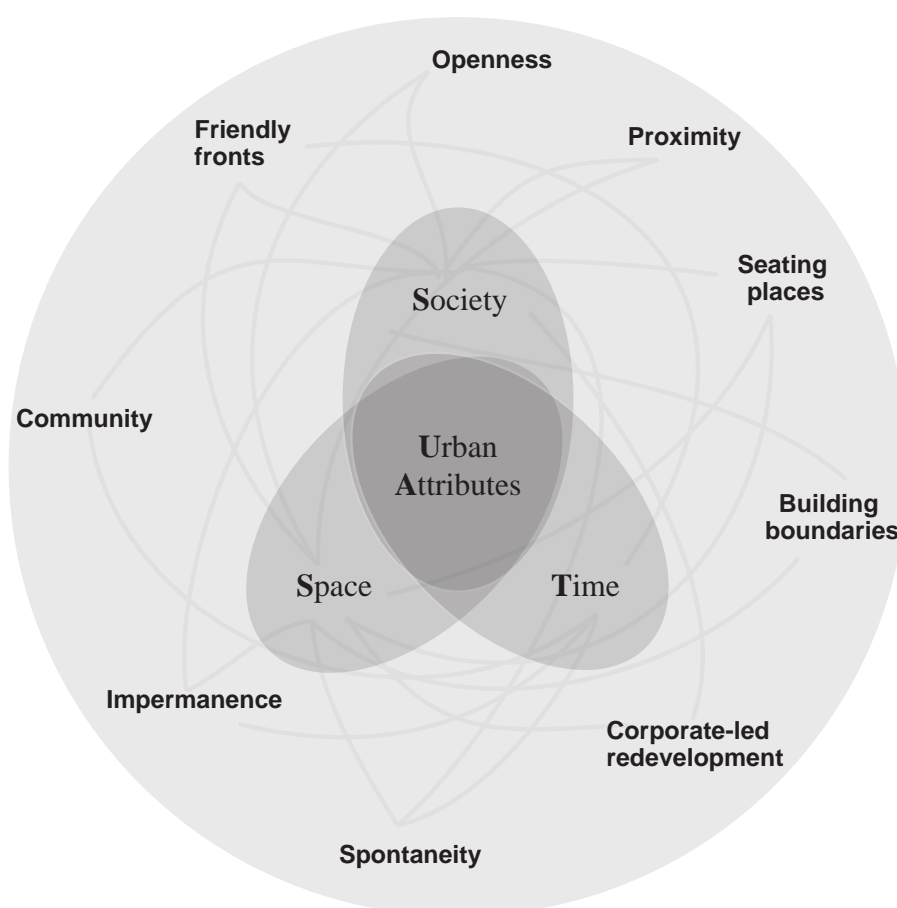

Fig.1-8 General Urban Attributes (GUA)
Source: Author

Based on the background and hypothetical approach previously mentioned, **this research aims** to clarify the composite characteristics of the street as a public space experienced at Eye level in Tokyo.

1.2 Research Methodology

In an urban area, like Tokyo, with the lack of big open spaces such as plazas, daily urban life can be experienced through the utilization of commercial districts. Japanese commercial streets could play a vital role as integral components of the walkable public space. In the enjoyment of strolling, the commercial streets could provide a place to stay and pause leisurely; in other words, they could allow pedestrians to linger instead of just connecting. Precisely, the explicit intention of attracting pedestrians through commercial strategies incorporated within their immediate spatial context, oriented towards the street. Speck¹²⁾ refers to the already-walkable street network as an anchor, as it encourages pedestrians to stroll further. This process is critical in shaping the large, modern metropolis, providing it with a distinctive character and vibrancy over time. In this context, two types of streets are the focus of analysis in this research.

Narrow street without sidewalks refers to a human-scale street that harmoniously accommodates both people and automobiles in a compact space through an invisible boundary. In some cases, it may or not include a visible line designating the pedestrian area, despite the absence of a raised sidewalk. Architectural elements that connect the ground floor facade of a building to the street may serve as the initial point of interaction between the building and the pedestrian. (Case studies ① and ②)

Street with wide sidewalks refers to a street big enough to support enough space to separate the roadway and a wide sidewalk for pedestrians. Due to the larger scale of the roadway, it can be inferred that automobile traffic is prioritized. Correspondingly, the dimensions and verticality of the buildings are greater, necessitating a stronger level of communication between buildings facing the street and pedestrians. (Case study ③)

The study of these types of streets altogether could provide potential strategies in the human-centered design of public spaces as Tokyo's specificities.

Case studies

This research focuses on two different districts of Tokyo, which present a distinctive character in the streets and buildings. Such neighborhoods are characterized by a constant state of change, with new stores frequently emerging, existing ones shutting down, and regular renovations or seasonal adjustments to storefronts. In Fig. 1-9, three case studies in commercial neighborhoods are selected for analysis.

① **Ura-Harajuku** is a backstreet area in the bustling district of Shibuya and is surrounded by grand avenues and boulevards, including Omotesando and Aoyama. Despite this, the neighborhood retains a human-scale environment where vehicles such as cars or bicycles and pedestrians share the same space. The constrained proportions of the buildings and streets in this area could allow pedestrians to enjoy the street as a place to stay, where the pedestrian's surroundings could significantly impact the dynamism of the street.

② **Shimokitazawa** is a neighborhood in Setagaya where the train lines from Odakyu and Inokashira intersect. The area is renowned for its many distinctive apparel shops, cafes, restaurants, small theaters, and music clubs. In recent years, the district has undergone a continuous transformation, which has served to reinforce a profound sense of local identity.ⁱⁱ⁾ In addition, this network of narrowed streets could have some permeability and influence the buildings to be more flexible and open to the street, luring pedestrians into the commercial buildings and deemphasize the use of the road primarily for vehicles.

③ **Omotesando** has been a representative street in the central area of Tokyo since its establishment in 1921. This primary road leads to Meiji Shrine and boasts a spacious driveway and sidewalk clearly separated and unusual for Tokyo standardsⁱⁱⁱ⁾. Nowadays, it is renowned as one of the most prestigious luxury shopping streets. In particular, the contiguity of unique commercial buildings along the Zelkova tree-lined boulevard could illustrate some of the ephemerality of the building frontages to enhance commercial activities and attract pedestrians.

Target areas

According to the case studies' characteristics, each case study will be analyzed through one target area, explained as follows.

① In Ura-Harajuku, **Ephemeral Public Space (EPS)** is understood as the surrounding place where pedestrians recurrently pause for a short-time along the street. (Fig. 1-10)

② In Shimokitazawa, **Temporary Edge (TE)** is analyzed as the zone in front of the storefronts that serve as a boundary between the street and the building. In this study, the space considered is 2 meters inward from the building's facade and 2 meters from

the end of the building site towards the street, where pedestrians can enter or stay for a short time. (Fig. 1-11)

③ In Omotesando, **Street Surface (SS)** is studied as the bounding layers of the built environment formed by the continuity of the commercial buildings standing contiguously one after another along the wide sidewalk, where pedestrians can stay near buildings. (Fig. 1-12)

1.3 Relevancy

This research discusses the Empirical Urban Attributes of commercial streets in Tokyo. The following academic papers related to streets and public spaces in Japan have been identified as relevant and are discussed herein.

Concerning *commercial neighborhoods*, Almazan²⁴⁾ suggests that commercial districts in Tokyo possess elements characterizing the urban-microspatiality of the city by studying the Yokochō Bar alleys. Arima²⁵⁾ classified commercial streets by looking at the store environment, behavior-inducing factors, and activities. The outcome showed that the stores with facades predominantly open to the outside are situated on pedestrian roads and equipped with behavior-inducing elements to stimulate purchasing activities.

In the study of the *physical appearance of commercial areas*, Koizumi²⁶⁾ examines the building heights in the district of Ginza through VR. The results suggest that the impression and openness of the facade increased with the use of glass mostly. Kato²⁷⁾ researches the semi-outdoor advertisements of the street facades; the outcome suggests that this element's disorder influences the streetscape of Ginza by transforming the urban informational environment. Zhao²⁸⁾ studies the dimension cognition of the facades in several buildings in Tokyo as an important element that gives various impressions of the design and can determine the image of the building. The result shows that the elevation's actual size influences the perception of the building's height and width. Though these studies define the importance of the physical features in these commercial areas, pedestrians using the space and their activities are not in their scope.

Concerning *Tokyo's spatial characteristics*, Nguyen Tran^{29), 30)} demonstrate the importance of the user experience in Open Spaces with Urban Gardening in Tokyo using a combined method of a survey together with a study of the variations of spatial qualities in the roof garden of mix-used buildings in Tokyo. Tabata³¹⁾ analyzed the streets of Harajuku as a collective form, where the characteristics of different zone types were identified based on the experience of the city. The study suggests that the individuality of the collective form and the unique character of the city enable it to undergo transformations over time.

Focusing on the *activities in shopping streets*, Yasumori³²⁾ analyzes the arrangements of elements in the street space in a practical study on a sidewalk cafe in Utsunomiya. The results clarify various scenes and settings in which people engage in activities such as standing, shopping, eating, and drinking while utilizing the chairs and tables placed in front of shops. This observation aligns with the findings of Inoue³³⁾, who conducted a study on the usage of terrace seating on private and public land in Daikanyama

and Yurakucho. These outcomes indicate that people using the outside space induce liveliness, which could be regarded as an essential characteristic of Japanese streets.

Furthermore, regarding *the survey methods to analyze the townscape*, Hatakeyama³⁴⁾, explores the changing appearance of color through a study on Sapporo and Otaru areas using photographic data to clarify the aspects of visual phenomena of day and night scenes in winter. Oi³⁵⁾ analyzes the diversity of people's evaluation of townscape by using the Caption Evaluation Method through workshops among different groups.

In analyzing the *temporal changes*, Yoshimura³⁶⁾ researches the arrangement and the division of the space between lots through transparent, open, and closed walls as a result of the temporal transitions of the streetscape. Ito³⁷⁾ examines the change in color of three streets in Nagoya over three periods, influencing the transformation of the urbanscape from the perspective of facade appearance. These researches suggest unique characteristics of changes in the streetscape but do not include pedestrian activities.

In the study of *permeable spaces*, Kamei³⁸⁾ uses the layer of permeable space in Daikanyama Hillside Terrace as an evaluator indicator of *okusei*. The findings suggest that various levels of permeability create a diversity of open urban landscapes, avoiding monotony and providing a stronger sense of depth. In addition, Saito³⁹⁾ studied the spatial configuration and pedestrian use of alleys on covered watercourses in Shibuya. The result indicates that an open and permeable public-private boundary is more likely to be utilized, thus enhancing a vibrant urban environment.

Regarding the *analysis of time-related factors*, Sakai⁴⁰⁾ conducted a study on plazas in Fukuoka that focused on the staying behavior of pedestrians, creating a 1-minute interval time layer map. The findings indicated that the length of staying time tended to increase as the number of people in a group increased. Additionally, it was suggested that pedestrians selected their space based on their awareness of other pedestrians and the purpose of their stay. Similarly, Okudaira⁴¹⁾ analyzed the behaviors of pedestrians in response to a temporary event in Chiba. The act of stopping or pausing was defined as stagnation, and the behaviors of pedestrians who stayed for more than one second and repeated the action were observed. The results showed that the activities of people within the venue influenced the pedestrians passing by, indicating that temporary events have the potential to involve and increase pedestrian activities.

These previous studies have helped to identify key features of public spaces in Japan related to spatial elements and people's activities separately. Contrarily, this research approach to understand the interaction and relation of these factors as composite characteristics in the commercial streets of Tokyo.

1.4 Thesis Organization

This research is structured as in Fig. 1-13. The content of each chapter is described as follows.

Chapter 1 provides an overview of the background and significance of streets as public spaces in the Japanese context. In addition, it presents a thorough literature review of the General Urban Attributes, both globally and within Japan. The Chapter also introduces the selected types of streets and the target area for each case study. Finally, the significance and uniqueness of this research are established by situating it within the broader context of past studies in this field.

Chapter 2 focuses on the narrow street without sidewalks, specifically investigating the recurring pauses of people along the street, known as the Ephemeral Public Space in the Ura-Harajuku neighborhood. The Chapter reveals that this phenomenon contributes to the dynamic character of the street.

Chapter 3 centers on the narrow streets without sidewalks in the commercial area of Shimokitazawa and examines the Temporary Edges to identify their permeability. The Chapter concludes by presenting the distribution of the composition and activity patterns that show the characteristics of the permeability of the streetscape.

Chapter 4 analyzes the street with wide sidewalks through the components of the Street Surface of Omotesando and pedestrian characteristics. The result reveals different patterns and levels of ephemerality.

Chapter 5 synthesizes the findings of Chapters 2, 3, and 4, discussing the Specific Urban Attributes of the streetscape in Tokyo and its contemporary characteristics. The aim is to provide an understanding of the discussions and investigations of the streetscape in Tokyo. The Chapter finalizes with a diversity of interactions between the Specific Urban Attributes and the General Urban Attributes.

Finally, Chapter 6 concludes the study by summarizing the results of the previous chapters and providing considerations for future research.

CHAPTER 1 Notes

- i) In reference 21), the space appears as a realm of objectivity, yet its existence is described socially. Geographical space is shaped through the widening and lengthening of routes and ways, resulting in established places and boundaries.
- ii) In reference 22), Shimokitazawa has been presented as more than just a typical downtown area, but rather as a livable and dynamic community that offers different kinds of shops and restaurants to enhance residents' quality of life. After residing in the area and conducting numerous interviews, the author has re-evaluated the identity of Shimokitazawa.
- iii) In reference 23), it is noted that the Meiji Shrine's approaches were trials carried out as city construction projects to materialize the modern ideal of the street, included in the new road system plan of 1921 before the 1923 Great Kanto Earthquake.

CHAPTER 2 Ephemeral Public Space in Commercial Streets of Ura-Harajuku

2.1 Chapter Outline and Purpose

2.2 Methodology

2.3 Components of Encounter

2.4 Characteristics of Ephemeral Public Space

2.5 Dynamism of Street

2.6 Conclusion

CHAPTER 2 Notes

CHAPTER 2 References

2.1 Chapter Outline and Purpose

In the study of the dynamism of Tokyo at Eye Level, this chapter aims to find the specific and common characteristics as a result of the pedestrians making a pause along two human-scale streets. The continuous frequency of these people stopping in the same space on different days is analyzed in parallel with its ephemeralityⁱ⁾. These intimate yet exposed spaces along the street are studied to clarify the activities enhanced for a short time in the dynamism of the street used as Public Space in the commercial streets of Ura-Harajuku in Tokyo. (Fig.2-1)

This chapter focuses on the ambiguity of boundaries that generates dynamism in the street, as a time-related characteristic of being non-static. This attribute in the cityscape could be a key to Japanese culture influencing the way people think about the quality of the townscape. As Shelton²⁾ mentioned, Japanese streets are distinguished from European streets by their performance, working as a canal of information where content prevails over context or form.

This chapter investigates Ura-Harajuku Streets used as a Public Spaceⁱⁱ⁾ by focusing on both, short-time paused people and their surroundings.

As an overview, this study analyzes data collection from fieldwork observation through digital photography. It is developed as follows: first, the concepts of Encounters and Ephemeral Public Space (EPS) are defined as well as the selection of the case studies (Section 2.2), second, the people found from the data collection are analyzed (Fig.2-2) (Section 2.3), third, the spatial elements are discussed (Section 2.4) and finally, the interaction of the two of them linked to the respective street reveals the distinctive characteristics of each, produced by the street dynamism in a mixed-use district (Section 2.5).

2.2 Methodology

The fieldwork observation was performed from January to May 2017 (Table 2-1), during weekdays and weekends, on sunny, cloudy, and rainy days. The collection of samples was done following a linear route from one end to the other of the selected case studies while taking pictures of the people making a pause for at least 5 seconds along the street, the people in movement was not considered for this analysis. The ground floor building facades are the main target, coined the term of Dutch origin, Plinthⁱⁱⁱ. With this in mind, the Plinth is regarded not only as part of the building but also as part of the street, impacting the pedestrian experience. (Fig. 2-3)

2.2.1 Case Studies and Fieldwork Observation

Ura-Harajuku is located in Shibuya, one of Tokyo's busiest districts. Surrounded by luxurious and large-scale avenues and boulevards, such as Omotesando Street, it is possible to find some of the intrinsic characteristics of Japanese Public Spaces in those human-scale streets that accommodate people and cars in a compact space, coexisting in harmony. In this study, considering the land use zones under the city planning in Japan^{iv)}, the case studies are narrowed to two commercial streets with an invisible boundary but with a visible line of an inexistent raised sidewalk, located in the zone designated to provide daily shopping facilities for the neighborhood, but at the same time, in between residential and bigger scale commercial zone, connecting either parallel or perpendicular to main avenues, Meiji Dori and Omotesando.

The street in the North is Harajuku (H) while the one in the South is Jingumae (J) (Fig.2-4). These streets are divided by numbering each plinth from West to East and naming facades at the North or South^{v)}. The result is 128 plinths, 42 in Harajuku and 86 in Jingumae. These two streets share some characteristics; for instance, the road is fewer than 6m wide with no raised sidewalk.

In the case of H, an average height of 5 floors approximately 15m^{vi)} is observed on the Northside (HN), while in the Southside (HS) the average height is 9m. It works as a backstreet of Meiji Dori with no indication of a pedestrian lane along the street. The total straight length from beginning to end is approximately 250m, half of Jingumae's.

On the contrary, J has taller buildings on the Southside (JS) with an average of 11.5m, while the Northside (JN) is 9.7m. The height along the whole street is more constant. J is slightly wider than H, where the pedestrian lane, around 1m, is marked on the pavement all along the 550m length.

Concerning the building occupancy, HN is occupied at 94%, while HS (77%), JN (76%), and JS (79%) occupied around 3/4 of the street. From this occupation, the plinths' building use are retail, restaurants, convenience stores, services^{vii)}, residential, use of advertisements, the mix of at least two of the previously mentioned, and no use. Although there are some similarities in both streets, retail is the predominant, restaurants and other services are a greater percentage, and convenience stores are less. In Harajuku, the use of the building as advertising is observed, in contrast to Jingumae, where there are more residential buildings on the North or South Plinths.

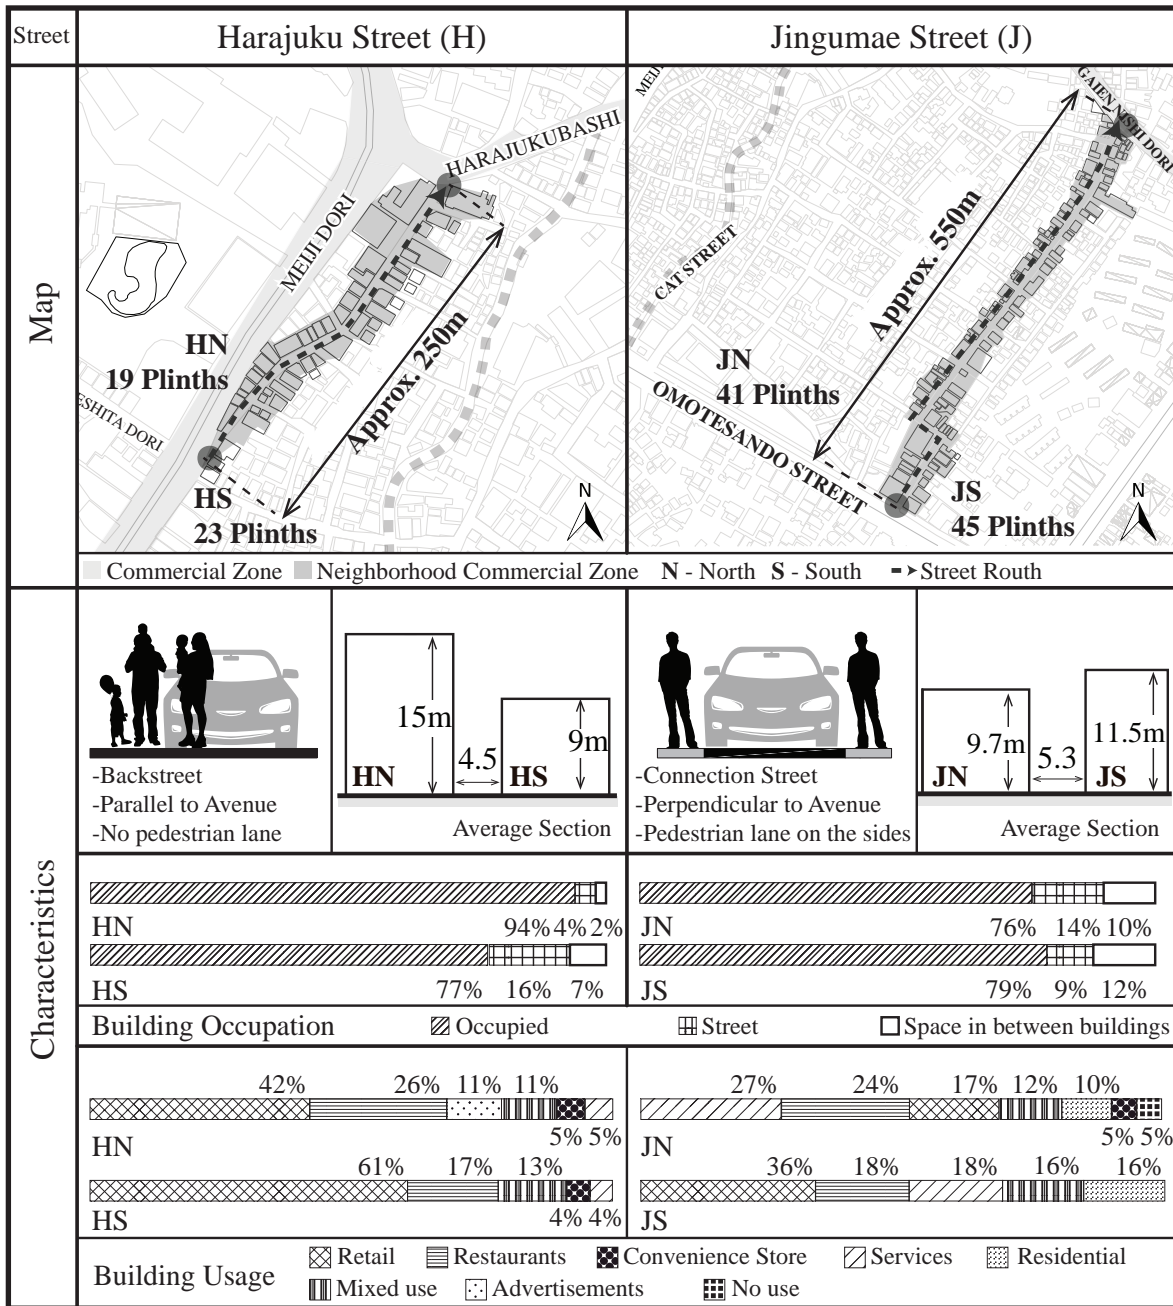

Fig.2-4 Case studies information and main characteristics

2.2.2 Definition of Encounter and Ephemeral Public Space

Considering the relationship between the character of street life and the inside building functions, the data collected is differentiated between people and place, Fig. 2-5 explains the identification of the following concepts and the information extracted from each photograph data of each plinth.

The Encounter of People along the street is considered when the pedestrian can freely walk around urban structures, making a pause and having a close distance between the building and the street. People's grouping, posture, placement, and activities are evaluated.

The term Ephemeral Public Space (EPS) is considered as the pause area where those instant Encounters are found. The street furniture and enclosure^{viii)} are studied. These concepts interact with each other as an extension of the personal space. Consequently, the places people frequently use are indispensable for the street used as a public space.

<p>2F</p> <p>Plinth (No. JN09)</p>			
<p>Street</p>			
<p>Encounter</p>	<p>① (No. J26)</p>	<p>② (No. J27)</p> <p>Personal distance</p>	<p>③ (No. J28)</p>
<p>Ephemeral Public Space</p>	<p>① (No. 29)</p>	<p>② (No. 30)</p>	<p>③ (No. 31)</p>

Fig.2-5 Example of Encounters and Ephemeral Public Spaces

2.3 Components of Encounter

From the 21 fieldwork observation days, 224 Encounters samples were collected, 83 in H and 141 in J, those are analyzed as detailed below.

2.3.1 Grouping and Posture

Following the previous definition, people’s grouping is investigated in both streets (Table 2-2). Singles and couples are identified when isolated, despite a group. In this research, individuals are considered a group when they share the same space, and their separation corresponds to intimate or personal distance, being less than 1.20m^{ix}. In Jingumae, approximately one-third of the Encounters are equally observed, singles (28%), couples (34%), or groups (38%); in Harajuku, 43% is single, followed by groups and couples, which was the least with 21%.

Table 2-2 People's grouping

Grouping \ Street	■ (75)	▲ (66)	● (83)
	Single	Couple	Group
H (83)	35 (43%)	18 (21%)	30 (36%)
J (141)	40 (28%)	48 (34%)	53 (38%)

*Number represent the collected sample

Table 2-3 shows the diversity of human postures observed within the study. While individuals engage in various postures such as sitting or squatting, standing constitutes the majority of observed postures. Additionally, the combination of postures, including squatting is also observed, further adding to the complexity and variability of human postures.

Table 2-3 Human postures

Posture \ Street	⚪ (147)	⚫ (77)			
	STA (147)	STASIT(11)	SIT (61)	SITSQ (1)	SQ (4)
	Standing	Standing and sitting	Sitting	Sitting and squatting	Squatting
H(83)	49 (59%)	6 (7%)	25 (30%)	0 (0%)	3 (4%)
J(141)	98 (70%)	5 (3%)	36 (25%)	1 (1%)	1 (1%)

Combined results indicate that the groups of individuals standing are dominant in both streets, followed by individuals standing alone and in a couple (Table 2-4). On the contrary, the mixed postures previously described are a minority, being the least squatting. Furthermore, the following majority in Harajuku is single sitting, and in Jingumae, couples standing, which shows a considerable difference between the dynamism of both streets.

Table 2-4 People's grouping and human postures

Grouping	■ Single (75)			▲ Couple (66)				● Group (83)				
Drawing	 (44)	 (28)	 (3)	 (39)	 (4)	 (22)	 (1)	 (64)	 (7)	 (11)	 (1)	
Posture	STA	SIT	SQ	STA	STASIT	SIT	SQ	STA	STASIT	SIT	STASQ	
Street	H(83)	17	16	2	9	2	6	1	23	4	3	
	J(121)	27	12	1	30	2	16		41	3	8	1

*Number represent the collected sample

2.3.2 Placement

The relation of the groups and postures concerning their placement is analyzed, and three main categories are identified: in the street (S), along the street^x (A) and in the plot (P) (Table 2-5). Although a compound of those categories is also considered, along the street (111/224) is the most frequent in both streets.

The outcome suggests that single individuals standing along the street are the majority; nevertheless, in Jingumae, standing people in the plot are considerable (52/141). There are fewer Encounters located in the street, including its combination.

Table 2-5 Relation of grouping, posture and placement

		SIT		3	5	0	0	
SITSO		0		0	0	1		

2.3.3 Activity

The urban space designated to a particular theme will separate the activities of the public, allowing interactions only between specific user groups, Table 2-6 shows the types of activities found in both streets and classified according to the group and postures as previously discussed in Table 2-2 and Table 2-3. When the activity fulfills all the parameters, it is named Basic activity (B) because some correspond to basic needs, such as eating or drinking^{xi}). On the other hand, a Specific activity (C) alludes to a particular user, and it could happen on only one street, showcasing their unique streetscape environment. For instance, giving samples, playing gacha-pon or looking at the menu.

Table 2-6 Activity Type

Activities \ Street	Harajuku					Jingumae					Type
Smoking	■	▲	●	☿	☽	■	▲	●	☿	☽	B Basic
Drinking	■	▲	●	☿	☽	■	▲	●	☿	☽	
Eating	■	▲	●	☿	☽	■	▲	●	☿	☽

Looking at the menu	/	/	/	/	/	/	▲	●	/	☽	

This classification leads to four Activity Patterns (Table 2-7). The majority indicate only basic activities corresponding to the pattern I (151/224). Specific activities only are 10%, pattern II (21/224). Two of these activities simultaneously correspond to pattern III (41/224), showing a wide range of human activities. Lastly, the minority is pattern IV (11/224), not doing any specified activities.

2.4 Characteristics of Ephemeral Public Space

The continuous frequency of pedestrians by Plinth is analyzed, and pedestrians stopping in the same space under different conditions are investigated, whether they have appeared at the same time or not supports the Ephemeral characteristic of the space. As a result, 45 Plinths are considered for this chapter^{xi)}, 20 in Harajuku and 25 in Jingumae, the Ephemeral Public Spaces by plinth are being differentiated by the surrounding area of the paused people, taking account of their personal distance^{xii)}. In total 61 EPS are identified (18 EPS in Harajuku and 43 EPS in Jingumae).

Intending to examine the characteristics of the space, a variety of street furniture^{xiii)} and building physical elements are observed and analyzed.

2.4.1 Street Furniture

Among the 61 EPS, 40 EPS are with street furniture (Table 2-8). The variety of these elements is either fixed (7) or movable (7), shown in Table 2-9.

The evidence suggests that the elements involved in the appearance of the EPS, such as seating (8), standing signs (6), traffic cones (5), and handrails (5), are physical support for the pedestrian as they are sharing the space, defining those resting places on a small scale. In contrast, the least observed is a Gacha-Pon machine (1), a mailbox (1), a tree (1), and a standing ashtray (2). These findings denote that although the street elements movable appeared in more EPS (27), fixed cannot be disregarded (20).

This information shows the variety of street furniture as part of the neighborhood's dynamism. The ephemerality of the EPS is observed through the movable street furniture's adaptable capacity according to the building's use needs. In contrast, the fixed furniture works as a part of the characteristics of the Street.

*In this table, number represent the quantity of Street Furniture identified in the EPS

2.4.2 Enclosure

In the 61 EPS, building elements, such as walls or eaves are classified as Vertical Surroundings and Horizontal Surroundings, as shown in Table 2-10. The evidence suggests that the majority of the Horizontal Surroundings in the EPS have no eaves (40/61), whereas the 35% are with eaves, making the space covered (21/61). The Vertical Surroundings in the EPS are equally enclosed on one side or more sides (26/61 each), while the least of the EPS are not surrounded.

Combined results of Vertical and Horizontal Surroundings with the street furniture show four Enclosure Patterns creating characteristics related to the encounters (Table 2-11). The number of EPS from 1 to 18 corresponds to Harajuku Street (H), while the number of EPS from 19 to 61 corresponds to Jingumae Street (J). There is a tendency for enclosed spaces delimited on the sides but uncovered (Q3, 32/61) and Covered-space delimited on the sides (Q1, 20/61) in both patterns. The presence of street furniture is predominant for Q3 75% and Q1 62.5%. Furthermore, most of the encounters in one EPS belong to pattern Q1, for EPS No. 15 in H and No. 30 in J.

The minority of EPS is Covered space (Q2, 1/61) and includes street furniture. A considerable number of Open spaces or Unenclosed are found (Q4, 8/61); in this pattern, street furniture is in half of the cases. Lastly, from the 18 EPS in Harajuku, 33% are Q1, 66% Q3, and 11% Q4, while in Jingumae, from the 43 EPS, 33% are Q1, 2% are Q2, 51% Q3, and 14% are Q4. In consequence, it was possible to find some similarities regarding the characteristics of the EPS in Ura-Harajuku.

2.5 Dynamism of Street

Attempting to find the unique elements of the selected case studies in commercial streets of Ura-Harajuku, composite characteristics of the streetscape shown by the Ephemeral Public Space with Encounters are analyzed in Fig.2-6.

Firstly, the Plinths and their usage are illustrated. Secondly, the Enclosure Pattern, with or without the street furniture, is indicated to show the characteristics of the space. Thirdly, the Encounters are described by quantities, and lastly, the specific activities.

These variables presuppose similarities; for instance, regarding building usage, the convenience stores in both streets generate a variety of EPS of people alone, in a couple, or in a group performing activities (Activity Pattern I, II, and III). In addition, retail stores and restaurants are enhancing EPS on both streets. Contrarily, only in Harajuku, EPS appear in some buildings used for advertisements, whereas in Jingumae, EPS appears in buildings with no use and mixed-use. Likewise, in buildings used for Services and Restaurants, EPS appear more in Jingumae.

Both streets reveal a similar number of Encounters on weekdays (H=34 and J=70) and weekends (H=41 and J=67). The result suggested that the more the space is enclosed (Q1), the more Encounters emerge; for example, there are more than 6 Encounters found regardless of the day of the week with this Enclosure Pattern, whereas open space (Q4) shows no more than 4 Encounters per EPS in both streets.

Regarding the allocation of EPS, the North-side of Harajuku enhances scattered EPS mostly with less than 5 Encounters from the beginning to the end of the street. It reveals three times more EPS than the South, where Plinths are dense and concentrate Encounters mainly on the West side. The 18 EPS are observed in 12 plinths, 75% in the North (9) and 25% in the South (3). Jingumae, on the other hand, displays Encounters and EPS intensively in the West, which is close to Omotesando Avenue. In this approx. 200m, 21 plinths have 43 EPS, 60% in the North and 40% in the South, while the East shows none.

For the grouping, it can be argued that people are attracted to the same plinths that other people, Crowd Spots either in front or next to each other can be observed in neighboring Plinths on both streets. Disregarding the day of fieldwork observation, the frequency of the people was noticed. In the case of Jingumae, there are six Crowd Spots with these characteristics. Two of them concentrated in the North are gradually incrementing Encounters reaching the peak at the middle of the Crowd Spot (E, F), while two of the Crowd Spots concentrated in the South (D, I) are showing the EPS with encounters on the side mostly. However, Crowd Spot G places most encounters in the

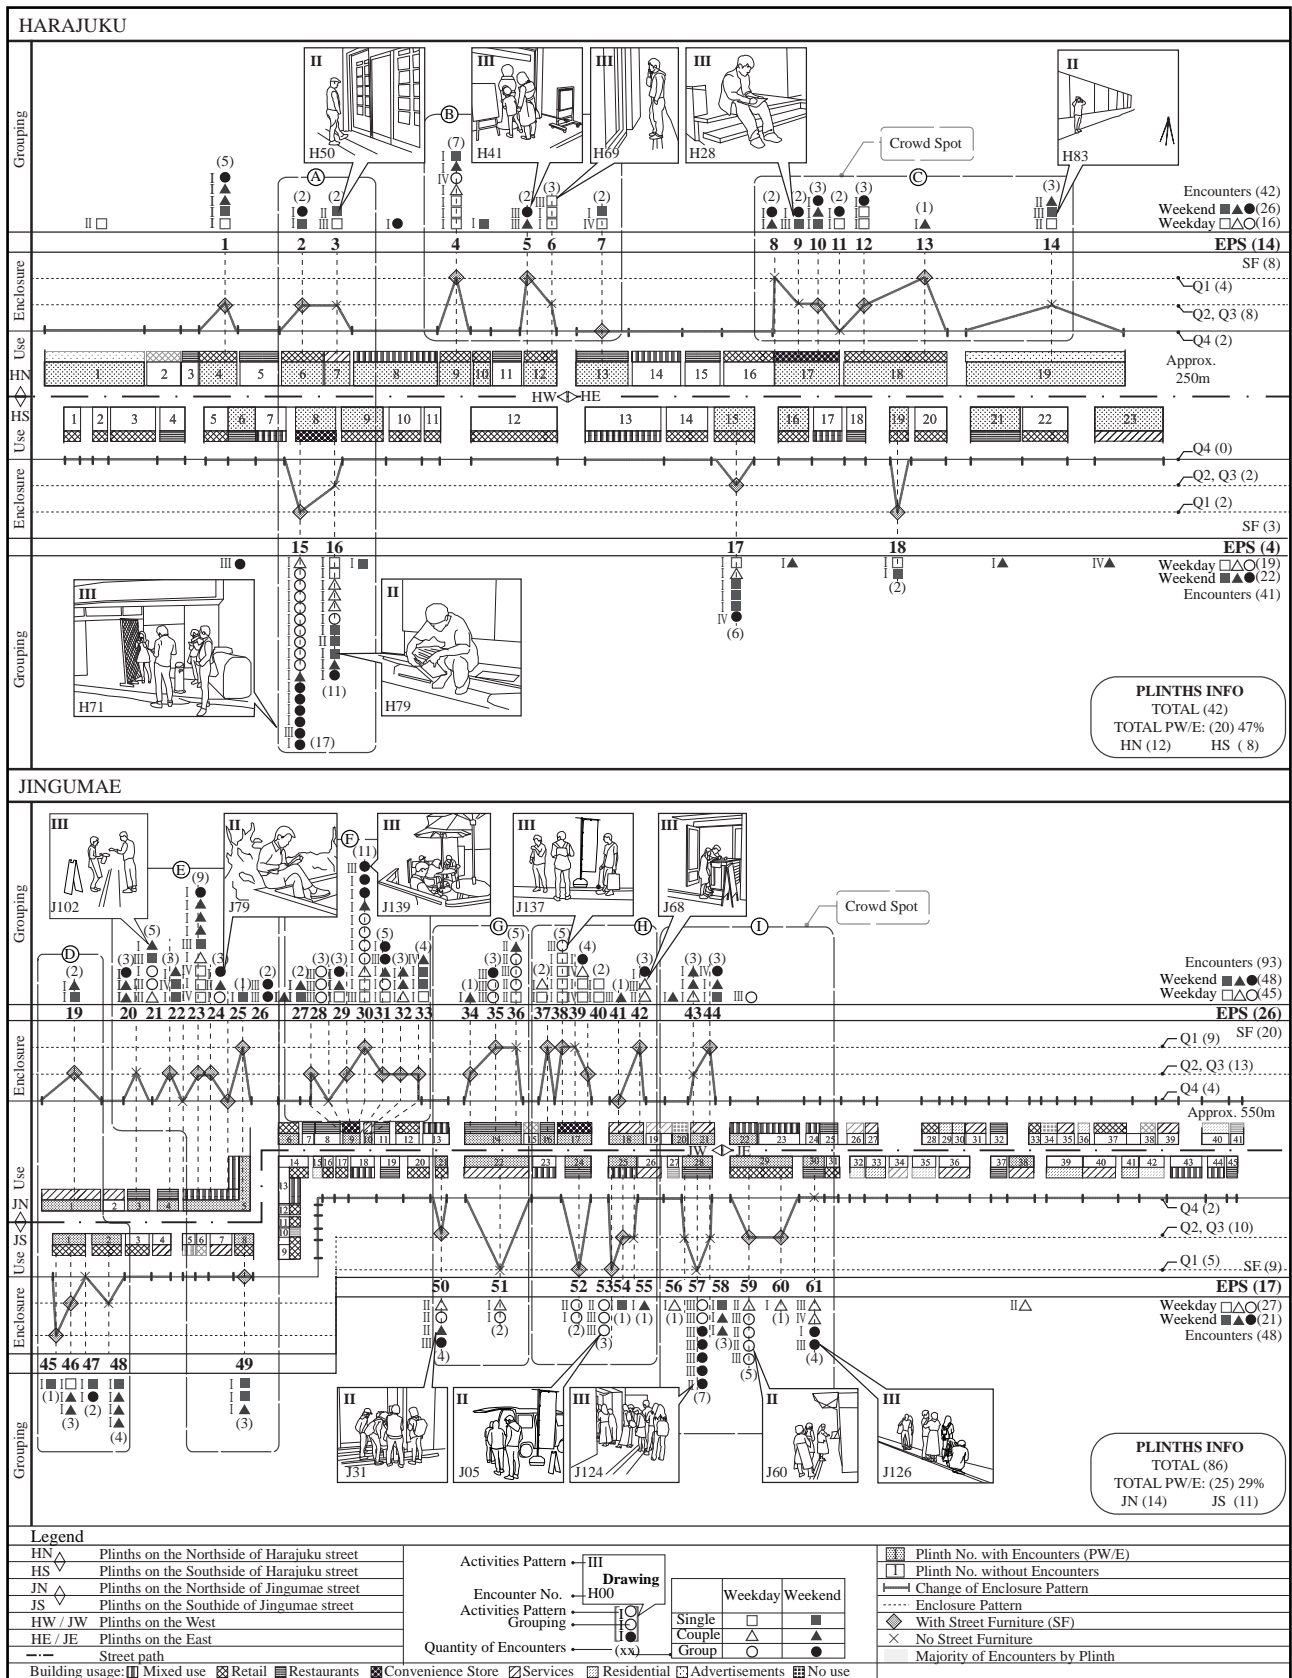

Fig. 2-6 Dynamism of the street given by the composite characteristics of EPS

*Activities Pattern is composed of cross patterns of people's grouping, human postures and activities from the analysis of Table 2-2, 2-3, 2-4 and 2-6, with all related symbols of ■▲● I II III IV

*Enclosure Pattern is composed of Street Furniture and Enclosure in EPS from the analysis of Table 2-8, 2-9, 2-10 and 2-11 with all the related symbols of ◆ ×

*All pictures are taken during the observation by the author

opposite direction either in the Northeast or in the Southwest. Crowd Spot H, on the contrary, has a balance of encounters in the South or the North. In Harajuku, there is pair of Crowd Spots revealing similarity to Crowd Spot H with a constant number from 1 to 3 Encounters in each EPS (B and C) the first Crowd Spot shows more Encounters (A) on the south with no disregarded small amount of Encounters on the North, similar to Crowd Spot D and I.

For the Street furniture, there is a similarity in both streets. Approximately 61% of the EPS include street furniture in H(11/18), while in J 67% are (29/43).

Considering the Activity Pattern, a repetition of the same activities performed in the same space is found. For example, in H EPS No. 15 and No. 16, the majority correspond to Activity Pattern I, which is the same case of EPS No. 30 in J. The location of the street furniture in the EPS could be an important factor for modifying the people's activities, for example, the bento van, which will support the Ephemerality, causing a different relation between the plinth and the enclosure of the EPS..

Lastly, the distinctive features emerge from the Grouping and the Activity Pattern. Harajuku indicates single individuals rather than in a group. On the contrary, Jingumae's specific activities are plenty and mainly in a group. This fact reveals more people's flow coming from the Eastside, which causes it to slow down and disperse the flow of people in the Westside. Furthermore, these occasional activities mingle with few and many Encounters. All in all, both cases suggest Ephemerality with undefined outlines, allowing interaction between users doing similar activities individually while sharing the same space.

2.6 Chapter Conclusion

In summary, after the analysis of two human-scale streets embedded in a mixed-use district, the dynamism of Ura-Harajuku's streetscape was studied. The ephemerality of the space was analyzed through the observation of pedestrians making a pause for a short time along the street. The continuous frequency of these people stopping in the same space, arbitrarily, was analyzed as an ephemeral characteristic of the dynamism of the streetscape. Those composite characteristics showed the activities enhanced for a short time shaped by the dynamism of the street used as Public Space in the commercial streets of Ura-Harajuku in Tokyo.

In Chapter 2.2, the concepts of Encounters and Ephemeral Public Space (EPS) were explained along with the selection of case studies.

In Chapter 2.3, people's data: grouping, posture, placement, and activities were analyzed. Combined results show a tendency of people to stand along the street, which enhances the dynamism of the street by stopping for a brief time. The Activity Pattern demonstrated that although there was more variety of Specific Activities, the Basic Activities performed the most were repeating in both streets. Although some of the activities and characteristics found in this research were as expected for the streetscape, there were also unexpected variants of encounters, such as reading or writing along the street.

In Chapter 2.4, the characteristics of the EPS, through their street furniture and enclosure were indicated. The recurrence of people in these places was found where space is surrounded either on the sides or top on any day of the week. Thus, it can be concluded that Encounters happen in places where people can see, but not be seen too much; this area is shortened to a semicircle backed up with the surrounding elements at the back or sides of the individual. Therefore, the possibility to stay next to the buildings supports ephemeral stationary activities as the opportunity to be partly hidden.

Finally, in Chapter 2.5, the variety of emerging interactions, such as the allocation of EPS and the crowds appearing in neighboring Plinths are found as specific and common characteristics, suggesting a dynamism of streetscape with the pedestrians in both of the commercial streets.

Furthermore, it was possible to find the unique character of each one; for instance, on Harajuku Street, the movable and fixed seating provided by the shops, from a chair to a bench, offers a cozy and comfortable atmosphere to do shopping. The essence of Japanese streets, in a mixed-use neighborhood, through the activities of people was observed. Taking photographs, playing with a Gacha-Pon machine, making bubbles,

giving samples as shop marketing campaigns, or queuing to buy bento boxes at lunchtime confirmed the ephemerality of this Megalopolis City.

Through the investigation of these two commercial streets located in a mixed-use neighborhood, it was possible to analyze two streets in the Ura-Harajuku urbanscape. The focus of this chapter was on the pedestrian pauses along the building facade and the street itself. The ephemerality of those intimate exposed spaces improving public life was clarified. The specific characteristics of each street determined the dynamism, working not only as a differentiator but as a similitude between the pedestrian activities and the spaces where they paused.

CHAPTER 2 Notes

- i) In reference 1), defined as the quality of lasting for only a short time. In this research, it is understood as a dynamic characteristic of the streetscape caused by people's behavior for a short time, frequently happening on the street as a public space. The temporal changes such as yearly seasons, duration and time of the day are not analyzed in this study.
- ii) In reference 3), Public Space is defined as an area within a building to which there is free access by the public.
- iii) In reference 4), Plinth is defined as the ground floor building façade.
- iv) As designated in the Shibuya Land Use Zones of 2019 (渋谷区の用途地域), the streets selected in this study correspond to neighborhood commercial area (近隣商業地域) in between the 1st class High-rise residential area (第一種中高層住居専用地域), the 1st class residential area (第一種住居地域) and the commercial area (商業地域)
- v) The terminology set to the first building on the Northwest side of Harajuku Street corresponds to HN01 whereas for Jingumae Street JN01.
- vi) The height calculation for each floor was made considering a round number of 3m to get an approximate total height of the building.
- vii) The building use considered as "Services" includes office, parking, hospital, hair salons, pharmacy, gallery and wedding venue.
- viii) In reference 3), Enclosure is defined as an area surrounded by a fence, hedge or wall, the building envelope is considered.
- ix) In reference 5), the research done by Hall shows that the Personal Space in the Far Phase is seen from two and a half to four feet, this means approximately from 0.60m to 1.20m.
- x) Based on the measurement on-site from the end of the pavement to the pedestrian sidewalk line, 1m and measuring the same distance inside the plot.
- xi) In reference 6), the types of outdoor activities in public spaces are divided into three categories.
- xii) To avoid the finding of the EPS by chance, only the Plinths with two or more encounters are being considered. In this understanding, 12 plinths where only one encounter was found are disregarded.
- xiii) In reference 3), Street Furniture is defined as the public space decor or useful elements. In the following table, the total amount of plinths with street furniture is described. It can be observed that more than 75% of the plinths with Street Furniture prevail in both streets (Harajuku 35/42, Jingumae 68/86). Considering the manifestation of EPS, plinths with street furniture are more predominant than the ones without street furniture (Harajuku 10/12, Jingumae 17/21).

	Harajuku			Jingumae		
	Plinths with EPS	Plinths without EPS	Total	Plinths with EPS	Plinths without EPS	Total
Plinths with street furniture	10	25	35	17	51	68
Plinths without street furniture	2	5	7	4	14	18
Total	12	30	42	21	65	86

CHAPTER 3 Temporary Edge of Buildings in Commercial Neighborhood of Shimokitazawa

3.1 Chapter Outline and Purpose

3.2 Methodology

3.3 Physical Components of Temporary Edge

3.4 Pedestrian Characteristics in Temporary Edge

3.5 Permeability Type of Temporary Edge

3.6 Distribution of Permeability Types

3.7 Chapter Conclusion

CHAPTER 3 Notes

CHAPTER 3 References

3.1 Chapter Outline and Purpose

The district of Shimokitazawa in Setagaya, Tokyo, as previously researched by Takahashi¹⁾ is renowned for its many distinctive apparel shops, cafes, restaurants, small theaters, and music clubs that are particularly popular among young people. In this neighborhood, the narrow streets lined with stores selling used clothing and other goods produce blurry boundaries that integrate the stores' atmosphere into the street, resulting in intimate human-scale streets. (Fig. 3-1)

In this context, the area where the buildings meet the street could offer the potential for a temporary stay, enhancing a lively neighborhood and connecting the inside to the outside of the building. Further, these features observed at eye level in Tokyo's streetscape would lead to a significant urban attribute of a human-centered design.

This chapter aims to clarify the characteristics of permeability in the commercial streets in Shimokitazawa by investigating physical components and pedestrians' characteristics of streets and ground level of commercial buildings.

This study analyzes data collection from fieldwork observation through digital photography (Fig. 3-2). It is developed as follows: first, the physical components of the Temporary Edge are defined (Section 3.3); second, the pedestrian characteristics in the Temporary Edges are analyzed (Section 3.4); third, the permeability types of Temporary Edges are clarified (Section 3.5); and finally, the distribution of the permeability types in Shimokitazawa commercial neighborhood is illustrated (Section 3.6).

Fig.3-2 Analysis example

3.2 Methodology

The survey area of this study is selected in the commercial neighborhood of Shimokitazawa, focusing on the streets located at the northern side of the stationⁱ⁾ where small-scale buildings are clustered in an area of approximately 36,000m² (Fig. 3-3). The majority of the commercial buildings are retail, followed by restaurants, services, and mixed-use.

Following preliminary site visits, field observations were conducted, as stated in Table 3-1, on six occasions in October 2022 and March 2023 on weekdays and weekends, under comfortable, clear skies and not extreme weather conditions. Observations were conducted along a designated 1.44km route from point A to point B, from 12:00 to 13:30 and from 15:00 to 16:30.

The observed area is the zone in front of the storefronts that serve as a boundary between the street and the building, referred to as the Temporary Edge (TE). In this study, the TE is defined as the space extending 2 meters inward from the building's facade and 2 meters from the end of the building site towards the street, where pedestrians could stay for a short time (Fig. 3-4). Considering this definition, out of the 119 commercial buildings under consideration, 128 buildings' facades face the street. These facades could be separated based on the entrance of the ground-floor shops. Therefore, each commercial building is divided according to the store number and the facade side number, resulting in 198 Temporary Edges considered for further analysis. The TE naming corresponds to the building number, store number, and facade side number. (Ex. No.28-1-1)

Each Temporary Edge was observed for two minutes, and photographs of these areas were taken at Eye-Level (1.5 meters from the ground). Simultaneously, to analyze the TE compound characteristics, photographs of pedestrian activities in the TE were captured when individuals stopped and did not move out of 1m² for 15 secondsⁱⁱ⁾.

Tab. 3-1 Fieldwork observation dates

Day	Date	Date	Date
Weekday	2022/10/04	2023/03/08	2023/03/17
Weekend/Holiday	2022/10/16	2023/03/12	2023/03/21

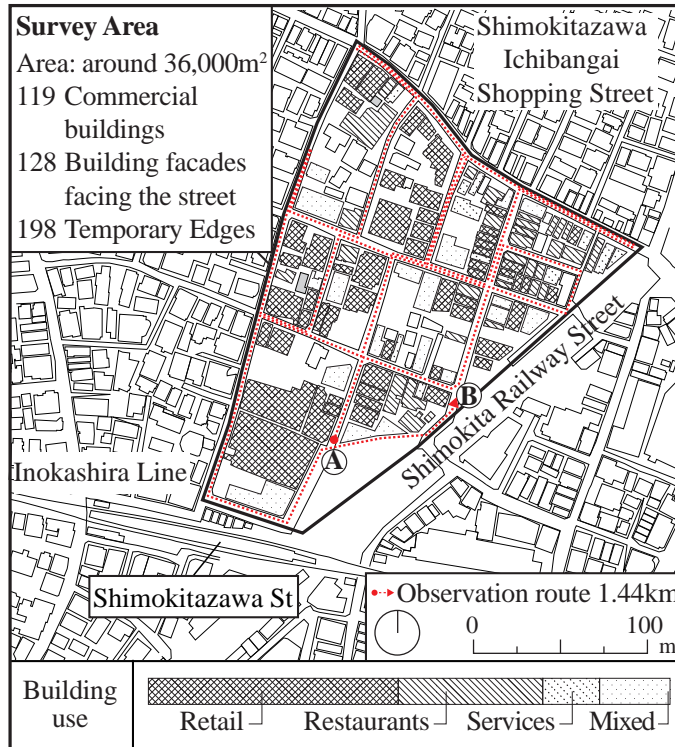

Fig. 3-3 Survey area and building use

Fig. 3-4 Temporary Edge and physical components

3.3 Physical Components of Temporary Edge

Three key factors were explored for the physical componentsⁱⁱⁱ⁾ of the Temporary Edge: the characteristics of opening, enclosure, and equipment (Tables 3-2, 3-3, and 3-4). In the characteristics of the opening, the results demonstrate that 60% of the Temporary Edges have large openings (124/198), primarily made of glass, but some are completely open. Around one-third have no opening, which could suggest that a connection with the exterior is preferable in these streets.

In the enclosure of the TE, a significant number are unenclosed on the sides (140/198), yet most have eaves (126/198). The combined results indicate only a minority of the TE lack eaves but are enclosed on the sides. This feature creates unevenness in the section contributing to the overall enclosed nature of the streetscape.

Additionally, regarding the equipment present in the TE, a significant proportion of over 80% (169/198) are commercial equipment, such as merchandise (119/198) or signboards^{iv)}(110/198), indicating that the majority are directly associated with a commercial character.

Other types of equipment, such as scenery and furniture, were also noted in less than half of the total TE. Among the scenery type, approximately one-quarter of the TE had a difference in level (53/198), followed by plant pots (28/198), and parasols were the least prevalent (1/198). Concerning the furniture type, the majority included seats (44/198), followed by desks (32/198), and lastly, ashtrays (1/198).

3.4 Pedestrian Characteristics in Temporary Edge

The utilization of the Temporary Edge was investigated through pedestrians' grouping, posture, location, and activities (Tables 3-5, 3-6, 3-7, and 3-8). A total of 698 groups^{v)} are observed during the field survey conducted on weekdays and weekends/holidays.

The data analysis revealed that the number of pedestrians doubled on weekends/holidays compared to weekdays, with 70% being part of a group (490/698). Irrespective of the day, the most common posture observed among pedestrians is standing, although the presence of sitting postures cannot be disregarded. The combined postures of standing and sitting are the least observed.

The location of pedestrians exhibits significant differences between weekdays and weekends. On weekends, a larger proportion of pedestrians are inside (124/201) and outside of the buildings (163/305), whereas, on weekdays, a higher number of pedestrians are on the streets (99/192). Despite approximately 44% of pedestrian groupings being outside of the buildings, the location between inside the building and on the street is relatively close at around 28% each. This outcome indicates the valuable role played by the building's edge, which separates the interior and exterior, thus shaping the pedestrian experience.

The most common activity observed among pedestrians is commercial (510/698), with eating, drinking, and shopping being the most prevalent activities. The results highlight the significant influence of commercial establishments on pedestrian activities, which tend to extend onto the streets, particularly on weekends. However, commercial activities continue to prevail on weekdays as well. Non-commercial activities, such as smoking, using mobile phones, or laptops, are observed more frequently (119/698) than the mix of commercial and non-commercial activities, which is the least prevalent (69/698).

*Numbers indicate the applicable groups out of 698 pedestrian's groups.

3.5 Permeability Type of Temporary Edge

The permeability type of the TE was examined by the combination of the physical components and the pedestrian characteristics of the Temporary Edge (TE) as depicted in Fig. 3-5. Firstly, the physical components of each TE were classified into six composition patterns, labeled A through F, based on the opening and enclosure's existence. The details of the enclosure and equipment are also indicated. On the other hand, the pedestrian groups observed in each TEs were classified into four activity patterns, from 1 to 4, depending on whether the pedestrians are engaged in commercial activities and whether they are located outdoors.

In the composition patterns, most TEs are pattern B, opening with glass and enclosed, followed by pattern C, enclosed with no openings. On the contrary, the minority are non-enclosed openings with no glass, pattern D. There is a similar quantity of patterns A, E, and F. In the activity patterns, the most prevalent is pattern 1, corresponding to commercial activities, while activity pattern 2 is absent when openings with no glass and no enclosure are present. Activity pattern 4, involving non-commercial activities, is observed across all the six TE composition patterns, being the majority with no openings, non-enclosed, and non-commercial activities.

Permeability types were examined by combinations of activity patterns and composition patterns. Pattern B, characterized by enclosed TE with glass openings, exhibits the highest frequency of pedestrian groupings, suggesting a higher permeability. Pattern A, featuring enclosed TE with openings but no glass, displays similar occurrences of activity patterns 2, 3, and 4. Patterns C and F lack openings, predominantly exhibit activity pattern 4, and few patterns 2 and 3. Only in pattern C are activity patterns 1 and 4 similarly represented, expressing a medium permeability. On the contrary, pattern D, referring to TE with openings with no glass and no enclosure, demonstrates overall few activity patterns, indicating low permeability.

In particular, pattern B exhibits more activity pattern 3 than other composition

patterns, which could be attributed to the presence of glass, which forms a visual connection to the outdoors, even within indoor spaces. Seating, desks, and other furniture could encourage prolonged stays, particularly in restaurants where seating arrangements near large windows create a sense of liveliness to the street.

The findings highlight that pedestrians engaged in commercial activities tend to stay inside and outside the building in response to the openings and enclosure of TE. Compositions that incorporate openings, enclosed TEs on the sides, and eaves could foster an affinity between these spaces and the high permeability of the streetscape, thereby attracting pedestrians.

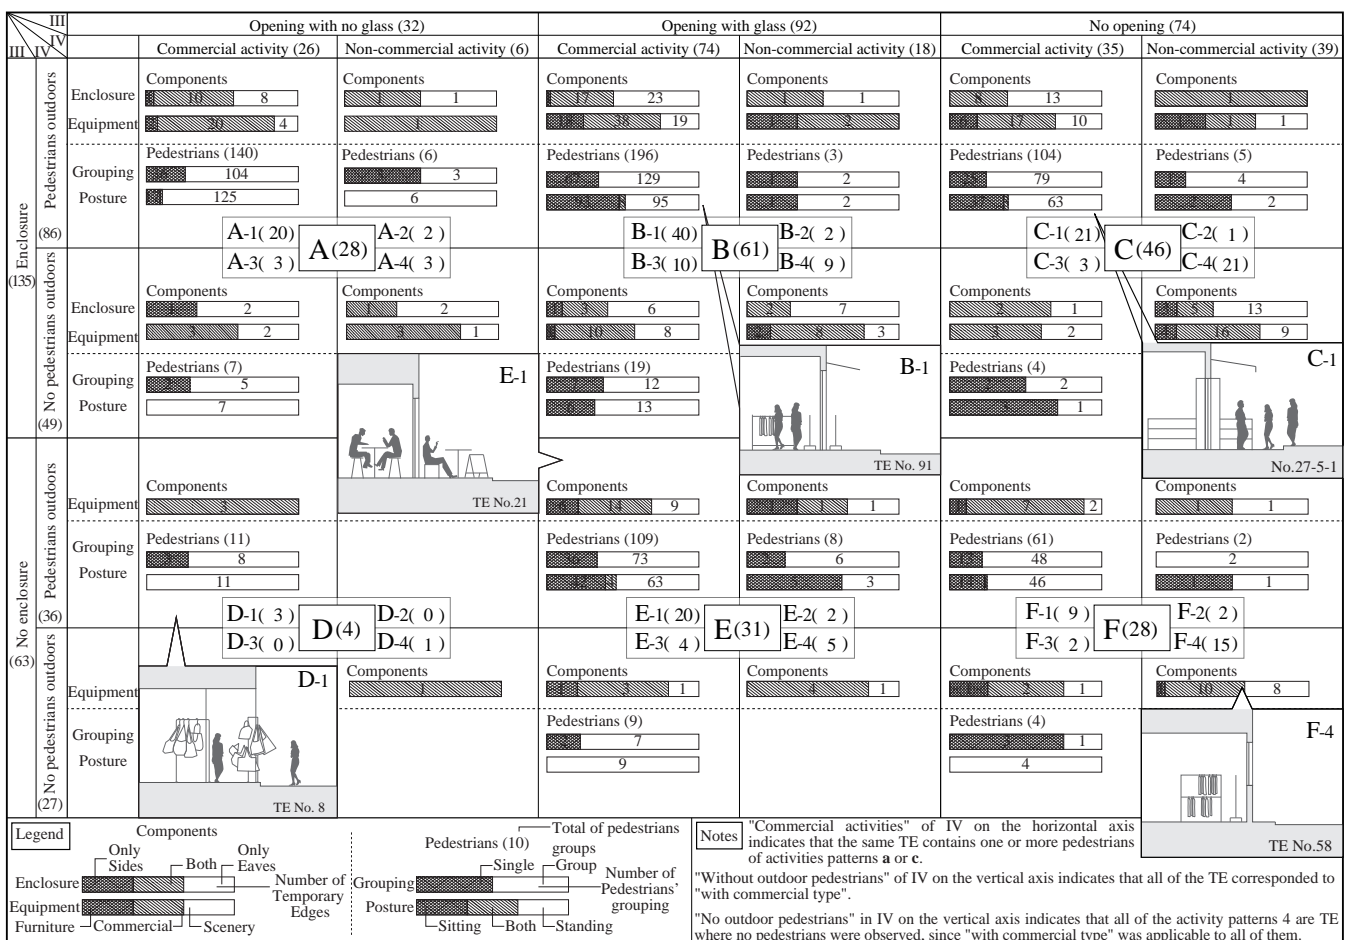

Fig. 3-5 Permeability type of Temporary Edge

3.6 Distribution of Permeability Types

The distribution of permeability types in Shimokitazawa was examined in Fig. 3-6. The central part displays the analyzed area distribution map designating the TE numbers in each building, and through distinct shapes and colors, their composition and activity patterns are depicted. Then, their distribution is considered from the permeability types sequences created along the street and the permeability types at the street intersections. Further, six scenes enhancing mutual interaction among the components of permeability were selected and illustrated.

Regarding the enclosed patterns with openings (composition patterns A and B), the distribution reveals a sequence of TE originating from the outer regions of the analyzed area and permeating toward the center. In contrast, the non-enclosed patterns with openings (patterns D and E) exhibit a more dispersed arrangement, except for the facades directly facing the pedestrian pathway (TE No.1-3 and 21), the west side (TE No.31-32, 43-44) and the northern corner (TE No.95-97).

In terms of activity patterns, areas with more pedestrians (activity patterns 1 and 2) display longer sequences of TE, extending from the Station East exit (TE No.22) to the adjacent eastern corner (TE No.17), and the longest sequence emanating from TE No.86 and 99, expanding towards the North and West sides. Contrarily, areas with fewer pedestrians (activity patterns 3 and 4) show fewer scattered sequences of three TE, except for the northeast side where these patterns are densely concentrated between TE No.163 and 140.

Considering the street intersections, the characteristics of nine intersections were identified. In the central area, a notable grouping of T-intersections denoted as i-6 and i-7, emerges as the focal point, exhibiting a wide-ranging variety of activity and composition patterns. Additionally, the remaining seven cross intersections show certain similarities, such as intersections i-1, i-2, and i-9, which predominantly display activity patterns 1 and 3. On the other hand, intersections i-3, i-4, and i-5 primarily manifest activity patterns 1 and 4. The composition patterns within these intersections vary from A to F. Lastly, intersection i-8 demonstrates several activity pattern combinations 1, 3, and 4 alongside composition patterns A, B, C, and E.

Finally, the scenes enhancing mutual interaction among the components of the permeability types are illustrated. In Scene 1, a coffee shop is allowing pedestrians to stand or sit on the outside bench. In Scene 2, one building with three retail shops with external merchandise is allowing pedestrians to linger at the TE. In Scene 3, an informal shop with an unstructured arrangement of merchandise is allowing pedestrians to

stop and interact along the street. Scene 4 and Scene 5 depict two adjacent corners, each displaying different patterns and fostering a diverse and dynamic environment within the streetscape. Similarly, in Scene 6, a rice cracker corner shop shows two distinct permeability types, one facilitating entry into the store and the other enabling customers to view the showcased products. These scenes exemplify mutual interaction as a temporal characteristic of the permeability types in the Temporary Edges of Shimokitazawa, affording an engaging and captivating experience at Eye Level.

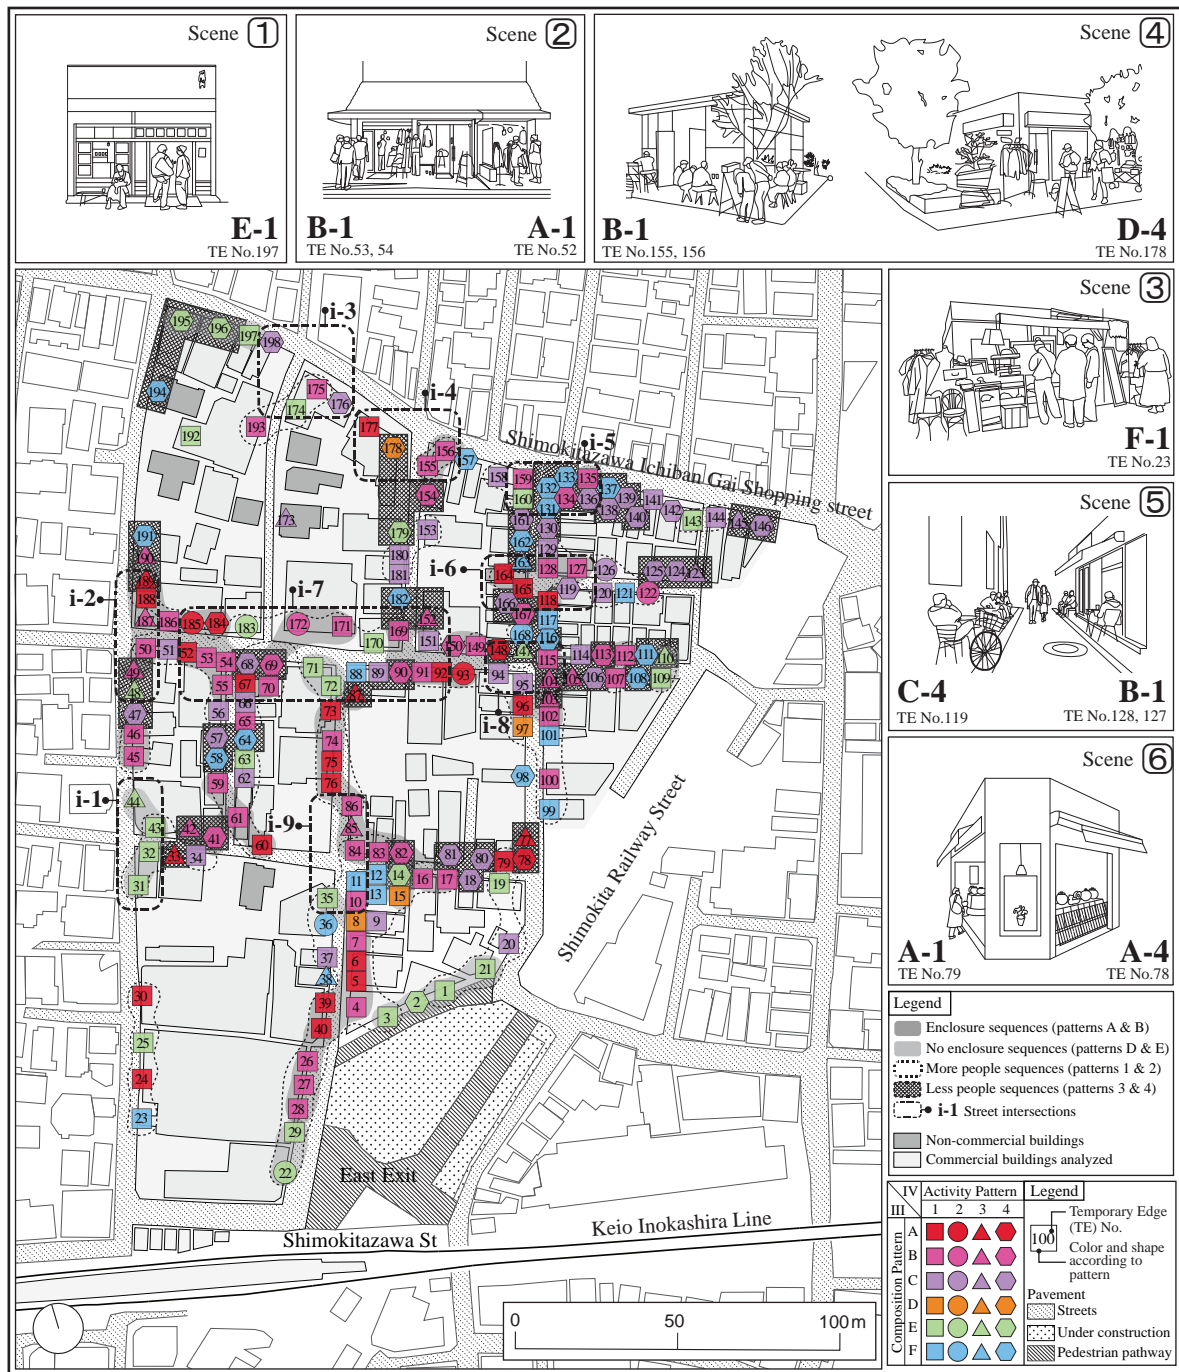

Fig. 3-6 Distribution of permeability types

3.7 Chapter Conclusion

This chapter investigated the characteristics of permeability of the Temporary Edges through the physical components and the pedestrians' characteristics. The result shows a variety of permeability types in the streetscape of Shimokitazawa, where the buildings, streets, and people converge at Eye Level.

The findings suggest that the Temporary Edges featured openings, over 60% primarily with glass or completely open; a significant proportion lacked side enclosures, but most had eaves. Commercial equipment is present in over 80% of them.

In the pedestrian characteristics, most pedestrians tend to be in groups, and regardless of the day, the most common posture observed is standing. On weekends, a higher percentage of pedestrians are found inside and outside of the buildings, whereas on weekdays, more pedestrians are on the streets.

These results indicate that commercial buildings would have a notable influence on pedestrian activities, and commercial activities are the most prevalent, but non-commercial activities are also observed. Higher permeability is indicated in enclosed TEs with openings with glass and a higher frequency of pedestrian groupings. In contrast, low permeability is expressed in TE with no glass openings, no enclosure, and few activity patterns.

Furthermore, the result reveals an uneven distribution of permeability types within the area. Sequences along the street and street intersections show similarities. Specifically, TEs with enclosed patterns with openings are observed from the outer areas towards the center. TEs, with more pedestrians, extended from the Station East exit to the eastern corner and from the center to the North and West sides.

CHAPTER 3 Notes

- i) As per the 2019 Land Use Zones of Setagaya(世田谷区の用途地域), the neighborhood and all the streets chosen for this study fall under the commercial district (商業地域). However, the buildings located on the east side correspond to the neighborhood commercial area (近隣商業地域) and are not considered for this study.
- ii) A 2-minute observation in each Temporary Edge was conducted, only the pedestrians who were seen lingering in the Temporary Edge for 15 seconds were included in the analysis.
- iii) The date chosen for analyzing the composition of TE is October 14th, 2022.
- iv) This research includes only the signs and banners on the ground as signboards.
- v) Pedestrians were grouped based on observations made during a 15-second period in which interactions, such as walking together or conversing with one another were observed and counted as one group.

4.4 Pedestrian Characteristics of Street Surface

4.5 Ephemerality of Street Surface

4.6 Chapter Conclusion

CHAPTER 4 Notes

CHAPTER 4 References

4.1 Chapter Outline and Purpose

Despite the presence of multiple commercial districts in Tokyo, Omotesando stands out for its variety of buildings situated along a single street that could generate a dynamic public space. Each building facade would be perceived mainly at the pedestrian's eye level and along the slightly sloping street.

In particular for commercial buildings, the sidewalk temporally used as an extension of the buildings could offer the potential to stop by, and each facade would work as a filter where the differentiation of shops and products becomes essential to attract people. (Fig. 4-1)

In this context, this chapter aims to clarify the characteristics of the ephemerality¹⁾ in Omotesando's streetscape of Tokyo through the investigation of composite factors, such as building facades, outside spaces, sidewalks, and pedestrians.

This study analyzes data collection from fieldwork observation as follows. First, the framework and case studies are described (Chapter 4-2). Then, the physical components (Chapter 4-3) and the pedestrian characteristics in the Street Surface (Chapter 4-4) are analyzed respectively (Fig. 4-2). Finally, the combination of these factors is investigated to clarify the characteristics of the ephemerality of the SS through the emphasized conditions patterns, their mapping considering the pedestrians' experience and the scenes created in Omotesando (Chapter 4-5).

4.2 Methodology

4.2.1 Concept and Framework of Analysis Method

In Omotesando Street, the commercial building facades and the sidewalk would resemble the stages where the building’s physical aspects and pedestrian behavior become part of ever-changing content. Moreover, considering Omotesando’s condition of commercial buildings standing contiguously along a wide sidewalk, this streetscape could be understood as a continuous surface. In this study, these bounding layers of the built environment are defined as Street Surface (SS), depicted in Fig. 4-3.

Each building facade and sidewalk are regarded as the main stage area, including the Outside Spaces (OS), which are interpreted as the area with variations from the outdoor to the hybrid indoor-outdoor space enclosed by the building. The SS physical components, such as facade elements, transparency, and equipment, with the pedestrian’s characteristics, such as grouping and activities, are considered compositely for the ephemerality of the streetscape.

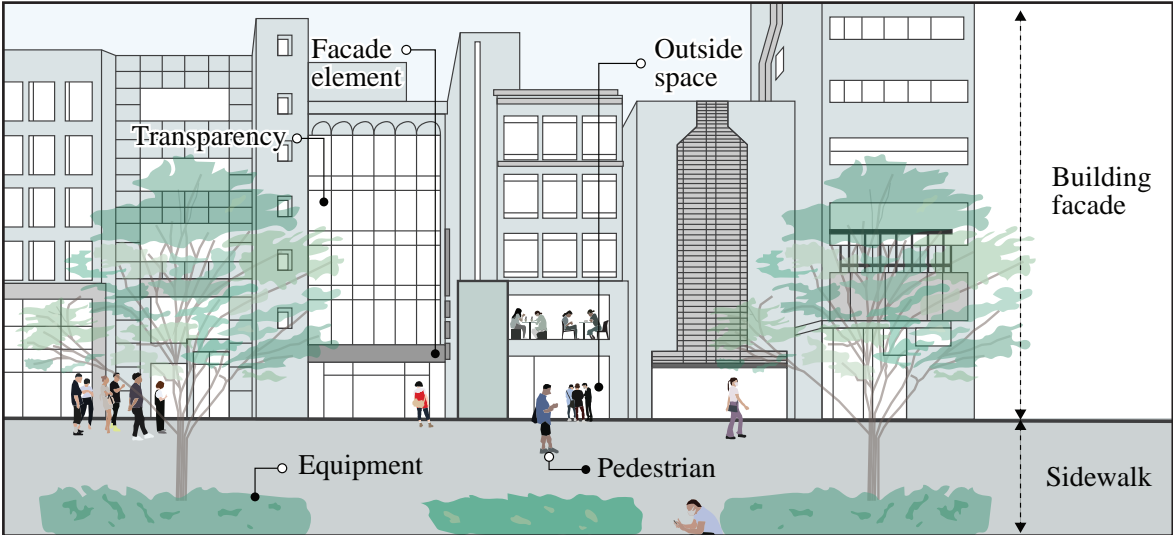

Fig.4-3 Components of the Street Surface

4.2.2 Case study and Fieldwork Observation

The survey area is Omotesando Streetⁱⁱ⁾, approximately 700m between Meiji Dori and Aoyama Dori (Fig. 4-4). Only buildings mainly used for commercial purposes are considered. Among the 47 buildings, 18 are on the north sidewalk, corresponding to eight blocks, and 29 are on the south sidewalk, corresponding to ten blocks. The buildings' usage majority are mixed-used or retail on both sides, aside from only restaurants or coffee shops.

After conducting a preliminary investigation in April 2021, the survey method was determined. The fieldwork observation was set from 15:00 to 17:00, considering when moderate pedestrian traffic would be happeningⁱⁱⁱ⁾, and conducted on four dates, two weekdays and two weekends, between April and October of 2021^{iv)} (Table 4-1). The authors photographed building facades and pedestrians making a pause in the OS and on the sidewalk for a minimum of 5 seconds^{v)}. These images were collected simultaneously on both sidewalks following a linear path from Aoyama Dori to Meiji Dori.

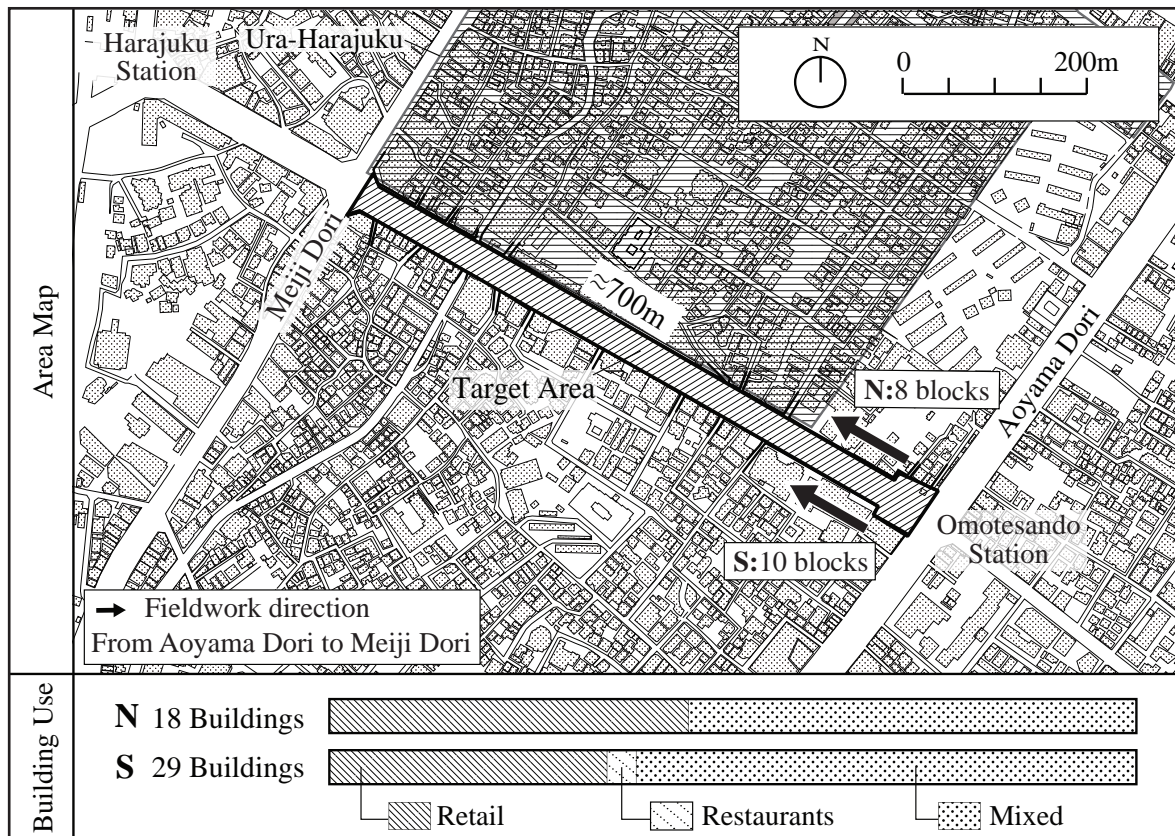

Fig.4-4 Survey area and building usage of the case study

Table 4-1 Fieldwork days and conditions

Fieldwork Conditions							
Date	Day	Weather	Temperature	Date	Day	Weather	Temperature
2021/4/30	Weekday	Cloudy	24°C	2021/8/22	Weekend	Cloudy	32°C
2021/6/14	Weekday	Cloudy	23°C	2021/10/23	Weekend	Cloudy	18°C

4.3 Physical Components of Street Surface

The building facades' physical characteristics, such as proportion, transparency and elements, and the distribution and setting of the outside spaces and sidewalks are analyzed.

4.3.1 Proportion of Building Facade

Each building facade proportion was analyzed by the frontage and height, considering their relation to the street (Fig.4-6). Around 80% (39/47) of the buildings' proportions are within a frontage and height of 30m. Most of their frontages are smaller than 10m, while their heights vary. On the other hand, a few long buildings exist, exceptionally a building frontage of 233m (Omotesando Hills (N4)). The result suggests a mixture of various scales, from human scale to big, tall, large, or long buildings.

Fig.4-6 Proportion of building facades

4.3.2 Transparency of Building Facade

In commercial buildings, the display and product presentation could be significant to attract customers; it is fundamental whether the inside can be seen or not. Therefore, in this study, the transparency ratio^{vi)} for each building facade was examined (Fig. 4-7).

The types of transparency were divided into the areas using glass, such as windows and display windows, partially transparent areas^{vii)}, and not transparent areas like solid facades. Then, their ratios for each building facade were classified by the percentage of the transparent areas into high and low, setting 50% as the threshold. Low transparency is more common (27/47) than high transparency (20/47). Regarding the types of transparency area, the display window area is generally low, indicating that many facades mainly use glass as windows.

Building facades with partially transparent areas could display commercial activities within the retail space, either directly or by adjusting the degree of transparency through decorative and removable adhesive films.

Fig.4-7 Ratio of transparency of building facades

4.3.3 Facade Element

The elements seen in the building facade could characterize the ephemerality of the streetscape by changing according to the season or the time of the day hereunder referred to as “Facade Elements” (FE). Table 4-2 shows the types of FE for each building facade in terms of how fast it can change, denominated as the span of change. More than 80% of the buildings have showcases (39/47), mostly with decorations, suggesting that the appearance of the building changes in a middle term span, related to the time of year and special events. In the short term span, the electronic signboard is the main type, followed by a few reflective surfaces^{viii}.

Table 4-2 Type of Facade Elements

Span of change		Type	Number of buildings
Short-term	Change within a day	Electronic Signboard	11
		Reflective surface	5
Middle-term	Change from 1 day ~ Changes with the season	Showcase	39
		Decoration	19

*Numbers represent the applicable buildings out of 47

The combination of FE types in each building facade (Table 4-3) shows that more than 90% (44/47) of the buildings have either single or multiple spans of change. The 46% (22/47) are multiple, including mixing short term and middle term FE and the other 46% (22/47) have a single span of change. Only 28%(13/47) have multiple types of FE with the combination of the short and middle term, indicating that their appearance changes within a day or season.

Table 4-3 Combination of Facade Elements

None	Single (22)		Multiple(22)		
	Short term	Middle term	Short term	Middle term	Short and Middle Term
3	2	20	0	9	13

*Numbers represent the applicable buildings out of 47

4.3.4 Distribution of Outside Space

The Outside Spaces (OS)^{ix} in the building facade could be considered as a place for people to stay or linger which would enhance the streetscape’s liveliness. Consequently, the number per building facade was examined. Figure 4-8 shows a total of 99 outside spaces with an average of 2.1 per building.

Fig.4-8 Number of Outside Spaces per building

Their sectional distribution was classified by their level from the street and their relation to the building (Table 4-4). It demonstrates whether they are continuous along the street and highly accessible for pedestrians passing by. The results indicate that the level distribution majority is on the ground floor (89/99), and many of the relation to the building (54/89) are contained in the building facade, creating spaces enclosed by walls and ceilings. These distributions combination are found the most (gi, 54/99) while the shallow depth of fewer than 2m is the most frequent among them (30/54). Further, the distributions at the ground level separated from the building are the second most (go, 35/99). These results indicate that the OS would tend to be enclosed and directly accessible from the street.

Furthermore, the shape of the OS was considered (Table 4-5). The width parallel to the street is mainly equal to or more than 2m (63/99) while the majority of the height is above one floor with no roof (38/99).

Table 4-4 Distribution of Outside Spaces

Relation Level	Separated (41)	Contained (58)	
		Depth < 2m	Depth ≥ 2m

*Numbers represent OS

4.3.5 Setting of Outside Space and Sidewalk

The setting of the OS and the sidewalk could affect the usability. Hence, these characteristics were analyzed through the equipment and the entry fee. For the equipment, physical elements in each building facade’s OS and sidewalk divided by the block^{xi)} were analyzed for their types regarding mobility (Table 4-6) and the number of their types in each location (Table 4-7).

There are few movable equipment types on the sidewalk, and most are within the OS. Among them, sign for commercial purposes is the most common, but in some OS, pole, table and chair are used for promoting activities.

On the other hand, fixed types, such as vegetation, decoration, railing, and sign, are found either in the OS or on the sidewalk, while their continuity along the roadway creates a typical characteristic of the streetscape. Considering the number of equipment types in each location, in the OS the majority is mainly with more than one type (45/99).

In addition, whether there is a fee required or not to access the OS for each building facade was analyzed in Table 4-8. About 90% (91/99) are free of charge; therefore, most are open to the public and could be considered as POPS^{xi)}. However, there is also around 10% tied to commercial use, such as cafes with required consumption (9/99).

4.4 Pedestrian Characteristics of Street Surface

The characteristics of the pedestrians making a pause in the SS would produce ephemeral dynamism to the streetscape. These characteristics are studied for their grouping, posture and activities.

4.4.1 Grouping and posture

At first, the pedestrians staying in the OS and on the sidewalk for at least 5 seconds were examined. The collection of 427 pedestrian groups^{xii)} was analyzed for their grouping and posture (Table 4-9 and Table 4-10). Small groups of single or couples are 80% and only 20% of groups above three people.

For their posture, 60% of people are standing, followed by 34% sitting. These facts suggest that pedestrians could be anchored differently in these places.

Table 4-9 Grouping

Single (S)	Couple (C)	Group (G)
204	141	82

*Numbers represent pedestrian grouping out of 427

Table 4-10 Posture

Sitting (SIT)	Standing (STA)	Sitting and standing (STS)
144	255	28

*Numbers represent pedestrian grouping out of 427

4.4.2 Activity Pattern

The type of activity of the pedestrians was classified firstly into commercial and non-commercial activities; commercial activities were subdivided into shopping and selling^{xiii)} (Table 4-11). For the commercial types in each pedestrian group, the majority of shopping is eating or drinking at a restaurant (28), standing in line (25) and eating and walking around (24) are also observed. For sales, people are mostly receptionists/guides (34) inviting to enter a shop, though selling small merchandise is also occurring. Most non-commercial activities are using mobile phones (185) and having a conversation (99); other activities are considerably fewer, such as smoking (9) or taking pictures (6).

Table 4-11 Type of Activities

Type of activities		Information	Description
Commercial (163)	Shopping (114)	Activities related with seeing or buying goods	Eating or drinking at a restaurant (28), standing in line (25), eating and walking around (24), looking at stores (13), looking at signs (10), talking to shopkeepers (8), browsing for goods (6)
	Sales (49)	Activities related with the business of the shop	Receptionist/guide (34), Security (7), Caller (4), Providing merchandise (3), Selling small merchandise (1)
Non-Commercial (307)		Activities not related with shopping or sales	Mobile phone (185), Conversation (99), Smoking (9), Taking pictures (6), Using computer/tablet (2), Reading (2), Parking (1), Exercising (1), Wedding (1), Interviewing (1)

The activity pattern was examined by the mixture of activity types for each pedestrian group considering their grouping, posture, and location in Table 4-12; regarding the location, the area was also distinguished by the street side, middle and building side. For the grouping, single and couple are mostly “b” non-commercial, while group shows a similar number except “d” non activities. Every posture shows the most number in “b” non-commercial; sitting tends to be “a” commercial rather than other postures. In the location of pedestrians in the OS, the most common type is “a” commercial activities (67/161); on the sidewalk, the most common type is “b” non-commercial activities, which are happening mainly on the street side (131/266). Further, non activities are found for every grouping, posture and location though this number is not the majority. Hence, not doing any of these activities could not be disregarded.

Table 4-12 Activity Pattern

Activity Pattern	Grouping			Posture			Location			
	S (204)	C (141)	G (82)	STA (144)	SIT (255)	STS (28)	OS (161)	Sidewalk (266)		
								Street side (187)	Middle (26)	Building side (53)
Commercial (98) a	43	29	26	27	68	3	67	20	1	10

Non-Activities (57) d	34	22	1	18	37	2	16	33	2	6

*Numbers represent pedestrian grouping out of 427

4.5 Ephemerality of Street Surface

The characteristics of the streetscape of Omotesando were examined by superimposing the physical components and pedestrian characteristics in the Street Surface, explained as follows.

Firstly, the physical and pedestrian factors of the SS were classified considering the emphasis condition according to the quantitative level of each factor (Table 4-13). For the building facade, the high transparency ratio and the combination of multiple facade elements are considered as a factor to increase the ephemerality in the SS. For the pedestrian, more than five people in the same location, either in the OS or on the sidewalk were considered. Besides, none of these components was also considered to emphasize a lack of dynamism. The combination of them shows the Street Surface pattern indicating more ephemerality, balanced, less ephemerality, and none. The patterns representing “More” ephemerality correspond to combinations where the emphasis condition is on three or more components, while “Balanced” refers to patterns where only half of the combinations are emphasized. On the contrary, “Less” denotes only one component, and “None” signifies the absence of emphasis on any of the components.

Second, the mapping of the collected data of Omotesando’s Street Surface was depicted by indicating the north and the south of the street on the right and left sides accordingly (Table 4-14). On both sides of the table, the physical components and the pedestrian’s characteristics were shown. In the middle, the distribution map displays the Street Surface Pattern, the building usage, the building height and the Zelkova trees along the street. Considering the pedestrian experience at eye level, the Street Surface was equally divided into 10m^{xiv)} intervals perpendicular to the sidewalk. Combinations of the physical and pedestrian factors of the SS were also divided and examined for each interval which was a total of 72 intervals on both sidewalks.

Table 4-13 Street Surface Pattern

Component		Quantitative Level	Combination of quantitative level																		
Building Facade	Transparency (T)	High	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■
	Facade Elements (FE)	Multiple	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■
Pedestrian	Pedestrians in OS	≥5	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■
	Pedestrians on Sidewalk	≥5	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■	■
Street Surface Pattern			4	3b	3p	2	2b	2p	b	p	n										
Ephemerality			More			Balanced			Less		None										

Concerning physical components, especially in the central areas of the north or south sides, building facades give brightness to the streetscape and enhance ephemerality. For instance, in blocks N4 to N6, which includes Omotesando Hills, the facade elements, such as showcases and electronic billboards, create a continuous long strip of commercial advertising by the repetition of mainly SS pattern b and 2b. On the opposite side of the street, in blocks S6 to S9, intervals of buildings facade with a high percentage of transparency and multiple facade elements tend to appear alternately in a group of buildings.

Regarding pedestrian characteristics, many activity types containing commercial (a,b) are in the OS. They are more likely to occur in places contiguous to the street and easily accessible, such as distribution “go”. In the OS with a fee required, many people are observed engaging in commercial activities only. On the other hand, the sidewalk is mainly used for non-commercial activities where single people are extensively found. Few people stay in front of the buildings without OS extending to the sidewalk. However, in blocks S10 and N2, the setback of the ground floor of the buildings and the incorporation of sidewalks intersecting the street create a small plaza-like space and a variety of people and activities appear. In block N7, the OS is actively used by people waiting to enter. Although the physical components of SS are evenly distributed throughout the entire street, in the street center, many places have no pedestrians, except for the OS.

In terms of the distribution of pedestrians, the north and south sides of the street have significant similarities in the west ends. In the case of b1 and b30, the two enhanced groups of people were either on the sidewalk or in the OS. In GYRE (b13), in the south side central area, the pedestrians are located at the building facade through the OS, where many activities occur. On the south side of the street, small groupings of people stay in the whole area.

Finally, focusing on the SS pattern distribution, the scenes representatively illustrate the ephemerality of Omotesando (Fig. 4-8). First, in the more ephemerality and balanced SS pattern, scenes 1 and 2 involve the positive impact on pedestrians, where various activities are performed while lining up and waiting to enter the store. In scene 1, the Apple store (b41) is shining with seasonable decorations, and people wait in front of the whole glass facade due to the limited reservations to enter the store, this building has other intervals where pedestrians predominantly emphasize the ephemerality so that the dynamism would be enhanced entirely. In scene 2, the Ralph Lauren Café (b37) has people eating and drinking in the café; both have people standing and talking, creating an integration to the street and extending to the sidewalk.

In the less ephemerality SS pattern, scene 3 demonstrates that the building facade is the main element of ephemerality. For instance, the advertisement's continuity intends to catch the pedestrian's eye. One example of this scene is Omotesando Hills (b38) continuing and repeating the SS pattern "b", with a continuous flat and rhythm-framed facade.

In contrast, Scenes 4 and 5 depict single people sitting on the sidewalk railing while looking at their phones. Scene 4 is composed of the SS pattern "p", creating a sense of community by sharing the same space with other people or waiting outside a store, like the accessory shop in building b33, where the facade and the OS are narrow and cause an overflow of pedestrians to the sidewalk, using it as an extension. Scene 5, like in b8, corresponds to the SS pattern "n", repeating in several places along the street. These two representative scenes show pedestrians staying on the ground floor OS and the sidewalk near the railings. Due to the less or lack of dynamism, the scenes make a sharp contrast with the emergence of the ephemerality of Omotesando.

Further, the proportion of the SS patterns indicates that less ephemeral (38.9%) and none (36.8%) represent the majority, followed by balanced (16.7%) and more ephemeral (7.6%). The result suggests the streetscape tends to be overall static. However, many places are also observed to have a medium quantitative level of SS components^{xv}; this implies these numerous moderate conditions create a background mode of Omotesando's streetscape as a latent dynamic. Thus, various levels of intensity of the ephemerality would appear from vivid to vague.

Scene No.	Scene 1	Scene 2	Scene 3
Illustration			
Building no.	b41	b37	b38
SS Pattern	4	2p	b
Ephemerality	More	Balanced	Less
Description	Pedestrians line up in front of a store. Previous reservation to enter is needed. Pedestrians are spreading onto the sidewalk, looking at the store, and conversing.	Variety of types of activities, people are lining up and spread into the open space in front of the building.	The continuity of the facade elements, for instance, showcases and digital signage, are observed to differentiate between the stores at eye level.

Scene No.	Scene 4	Scene 5
Illustration		
Building no.	b33	b8
SS Pattern	p	n
Ephemerality	Less	None
Description	Pedestrians sitting along the railings respect the personal distance between each other. Separate but together.	Single people sitting alone along the railing. This scene is observed scattered along the street.

Fig.4-8 Scenes of the Streetscape of Omotesando

4.6 Chapter Conclusion

Considering the unique dynamic aspects of the public space in Tokyo, the characteristics of the ephemerality in Omotesando's streetscape were investigated.

In chapter 4-2, the concept of the Street Surface (SS) was defined as the continuous area of building facades, outside spaces (OS) and sidewalks. The analysis method was set from the data collected from fieldwork observation regarding the physical components and the pedestrians stopping for a brief time in the SS.

In chapter 4-3, the physical components were analyzed by the building facades through proportion, transparency and facade elements (FE), and the distribution and setting of the OS and on the sidewalk. The results show low transparency using mainly glass windows and the facade elements with the middle term span change, such as showcase, are more common. The outside spaces are allocated overall on the ground level enclosed and more than 2m wide. The movable equipment types and free of charge are the majority, while the sidewalk tends to have fixed equipment types.

In chapter 4-4, the pedestrians' characteristics were studied through their grouping, posture and activities. Small groups of single or couple, postures of standing or sitting are the majority. The activity patterns are mainly non-commercial, which is the most observed in every grouping and posture, mostly on the street side of the sidewalk, while commercial are found predominantly in the OS.

In chapter 4-5, the ephemerality of the Street Surface was identified through the SS pattern, mapping and representative scenes. The result shows the intervals with the intense quantitative level of building facades widely appearing in the central area of the north or south sides. The distribution of pedestrians indicates similar conditions; in the west end, the enhanced groups of people are found both in the OS and on the sidewalk, and a specific building facade where many people and activities occur in the OS. The representative scenes and the proportion of the SS patterns reveal more ephemeral is least frequent, and the majority is less or non-ephemeral. However, many places also have a medium quantitative level of SS components that implies a latent condition enhancing the ephemerality.

Finally, this chapter confirmed the dynamism in a commercial street in Tokyo where the buildings, street and people converge at eye level. The ephemerality of Omotesando was clarified through the composite factors of the Street Surface and its pedestrian characteristics.

CHAPTER 4 Notes

- i) In reference 1), defined as the quality of lasting for only a short time, Ephemerality is understood as a dynamic characteristic of the streetscape caused also by people's behavior for a short time. Furthermore, in this research, the analysis involves building facades, outside spaces and sidewalks to clarify their composite characteristics.
- ii) As designated in the 2019 Land Use Zones of Shibuya (渋谷区の用途地域) and Minato (港区の用途地域), the commercial street selected in this study corresponds to the commercial district (商業地域), linearly stretches and adjoins the 1st class High-rise residential area (第一種中高層住居専用地域) and the 1st class residential area (第一種住居地域).
- iii) Omotesando street is often densely crowded. Despite being a significant aspect of the street, it may limit the potential for pedestrians to make a pause or linger in this area.
- iv) In reference 2), the pedestrians' usage of the street spaces in Ura-Harajuku is investigated before and during the Pandemic of COVID-19. The results show that pedestrians continuously use the street space and perform activities for a short time, despite the prevailing conditions. However, it is worth noting that this behavior may have been influenced by the need to maintain social distancing, which could potentially impact scenes 4 and 5, as depicted in Fig. 4-7.
- v) Regarding the objectivity of the time setting, at least 5 seconds was considered for the analysis of pedestrians engaged in activities, consistent with the approach outlined in Chapter 2. Any activities observed beyond the initial 5 seconds threshold have been excluded from the fieldwork observation and subsequent analysis.
- vi) The calculation was considered only from the ground floor until the fourth floor of each building concerning the eye level of pedestrians walking on the sidewalk.
- vii) Additions to glass surfaces, such as louvers and curtains, and glass treatments, such as adhesive films and tinted glass, were considered.
- viii) The considered materials are more reflective than transparent, allowing the reflection of the landscape on the surface.
- ix) The analysis includes only the outside spaces seen from the sidewalk.
- x) The block of the sidewalk was divided by the crossing roads. The total number is 18 blocks, ten on the south and eight on the north.
- xi) Privately Owned Public Space (POPS) in reference 3) is a term coined by the city of New York in 1961 when it adopted an incentive zoning by offering some benefits in exchange for plazas, arcades, or atriums that could be accessible by the public.
- xii) Pedestrians who make a pause for around 5 seconds were grouped. According to reference 4), the social distance (close phase) is seen approximately from 1.20m to 2.10m. Therefore, in this research, the pedestrians in the surroundings of 2 meters were considered as one group.

- xiii) For the type of activities, all the activities observed are considered in the total number of people regarded as a pedestrian group.
- xiv) Considering the pedestrian's experience while walking, the interval was set so that the street surface factors would be perceived sequentially every 10m.
- xv) The medium quantitative level has not been applied to the classification of the SS pattern. Considering the threshold with the medium level, the proportion of the SS pattern changes, as explained in the table below.

Ephemerality		More	Balanced	Less	None
Change of threshold of the quantitative level	Without medium	7.6%	16.7%	38.9%	36.8%
	With medium	64.6%	18.8%	11.8%	4.9%

CHAPTER 5 Empirical Urban Attributes at Eye Level of Commercial Streets in Tokyo

5.1 Chapter Outline and Purpose

5.2 Specific Urban Attributes of Commercial Streets in Tokyo

5.3 Chapter Conclusion

5.1 Chapter Outline and Purpose

The objective of this chapter is to examine the Empirical Urban Attributes (EUA) based on Tokyo's specificities analyzed in preceding chapters, while establishing a correlation with the General Urban Attributes (GUA) and Specific Urban Attributes (SUA).

5.2 Specific Urban Attributes of Commercial Streets in Tokyo

In Chapter 1, the Urban Attributes were described as the significant interaction of society, space, and time, which would potentially produce lively spaces in the street. The nine selected General Urban Attributes were denominated by referring to several investigations of urban public spaces at Eye Level in addition to suggesting the potential of Specific Urban Attributes experienced on the commercial streets in Tokyo.

In Chapters 2, 3, and 4, for clarifying substances of SUA, three target areas (Ephemeral Public Space, Temporary Edges, and Street Surface) were examined. From understanding the observed results in these Chapters, the nine SUA could emerge as the different features of GUA, such as contrast, expansion or advance, as explained in the following description.

Indirect socialization: The concept of **Community** discusses the importance of social activities in vibrant public spaces and “activity nodes,” where people converge to form temporary communities. In the context of Tokyo's commercial districts, this can be observed as **Indirect Socialization**.

One example occurs through *sharing common activities*, such as smoking in public spaces, which is limited to designated areas, resulting in the creation of small spaces where people can smoke together while maintaining some level of separation.

Another form of Indirect socialization in Tokyo is through *sharing common space*, such as the immediate space outside of convenience stores, which offer amenities like seating, restrooms, and eating, drinking, and smoking areas. These spaces foster a sense of inclusivity and safety and are accessible to everyone.

Indirect socialization *for sharing on social media* has also contributed to the exchange of unique experiences among users. For instance, walking uncommon pet animals like pigs or rabbits draws the attention of passersby who take pictures of these phenomena. (Fig. 5-1)

Engagement: Considering **Friendly fronts** to contribute to the daily life experience, there are several factors to consider beyond creating only an attractive facade for pedestrians. From the experience in Tokyo, engagement with the outside environment could take the form of a visual or tangible element, as strategies that not only enhance the visual appeal of the storefront but also create opportunities to interact and generate foot traffic.

A *visual connection* is established by creating an open or glass facade, allowing passersby to see the interior of the building, partially or completely. (Fig. 5-2)

On the other hand, a *tangible connection* is established by leaving merchandise spilling out, enabling people to touch and choose items without entering the shop. (Fig. 5-3)

Closeness: Ground floor facades' **Openness** can enhance the pedestrian experience by fostering interaction. Contrarily, in the case of narrow streets without sidewalks, closed ground floor facades have been observed to hold significant potential for enriching the urban experience through two distinct types.

The first example includes *closed ground floor facades next to shops*, which are often used by small takeaway businesses without seating areas. These facades provide an area for customers to eat without disturbing pedestrians or other businesses nearby. (Fig. 5-4)

The second example is *closed ground floor facades for advertisements*, in particular featuring popular celebrities or idols. These facades add to the vibrancy of the street by creating a lively atmosphere and encouraging interaction between passersby and the advertisements. (Fig. 5-5)

While closed facades may initially appear to diminish the quality of the urban environment, these examples demonstrate how they can actually contribute to a dynamic and diverse urban fabric.

Smallness: Even though words and symbols could work as a means of communication through **Proximity** to intensify shopping experiences in wide streets, Tokyo's small commercial streets and alleys could offer a more intimate and human-scale experience that allows people to be more aware of their surroundings, including other people and forms of transportation. The seek for larger spaces in urban design would have led to a neglect of the potential benefits of smaller spaces that could encourage exploration, leading to a more enjoyable experience both outside and inside commercial buildings.

Informal seating: Well-designed public spaces that provide “good” **Seating places** are typically considered desirable locations for people to spend time. However, in Tokyo’s commercial streets, the lack of seating makes squatting happen in various contexts, such as waiting in line, socializing, and taking a break. Additionally, squatting is also viewed as a more casual and relaxed posture than sitting on a bench, making it last for only a short time. As a result, in addition to seating areas, there are other locations where people feel comfortable staying without entirely sitting. (Fig. 5-6)

Another example is the street with wide sidewalks, where people were frequently utilizing the railings along the sidewalk (Fig. 5-7) or leaned against the facades of nearby buildings. The sidewalk was often used as a busy pedestrian racetrack-like where these spaces serve as gathering places for individuals. This design element provides a secure area for individuals to wait, eat, or work along the busy boulevard.

Blurry Boundaries: Building boundaries of streets may appear rigidly defined by the street-sidewalk-building interface, even the secondary and primary profiles are attached to the building facade. However, in practice, these boundaries can be flexible and adaptable to changing circumstances in the street. In Japan’s commercial neighborhoods, it is common to find advertisements from various directions directly on the street. For example, movable signage serves as an extension of the shop and can be situated in the pedestrian path to attract attention. Additionally, it offers the convenience of being adjusted or moved as needed. (Fig. 5-8)

Guerrilla consumers: One of the contemporary challenges associated with **Corporate-led redevelopments** is the perception that some public spaces may appear open and accessible but are intended for commercial consumption. These spaces may require the purchase of goods or services from neighboring businesses and may be subject to restrictive operating hours. Even though they may also suffer from potential challenges in terms of access and inclusivity, the accumulation of these spaces could contribute to the overall streetscape experience by adding vitality to the area as depicted in Fig. 5-9.

Customization: In contemporary urban environments, flexible spaces that can accommodate diverse situations and contexts has become increasingly important. However, what may appear to be **Spontaneity** in the transformation of spaces is often the result of the customization of space or business decisions.

During the COVID-19 pandemic, many urban areas were subject to new restrictions and regulations that required businesses to be adaptable in their operations. For instance, some stores implemented protocols such as limiting the number of customers allowed inside at any given time, resulting in lines forming outside (Fig. 5-10). This fact highlighted the importance of the sidewalk as a public space. Similarly, in pleasant weather, restaurants and shops may spill out into the street, further customizing from the indoor to the outdoor spaces, adding vibrancy to the urban environment. (Fig. 5-11)

Time ranging: In Japanese culture, temples or houses would not intended to be permanent structures, instead they have an established **Impermanence**. An example of this practice is the Ise Shrine, which is disassembled and rebuilt with meticulous attention to detail every two decades. Another example is wooden houses, which are typically designed to last only between 20 to 30 years. In the bustling commercial streets of Tokyo, this philosophy of impermanence could be reflected in the varied lifespan of the built environment.

Short-time. It refers to temporary events or gatherings that last only for a short period, often for an hour or two daily or weekly. Examples in Japanese commercial streets include bento vans or bento stands. (Fig. 5-12)

Medium time. It involves the appearance of pop-up stores or promotional campaigns as a means of introducing new products or services, often seasonal-related. These campaigns are frequently time-limited, occurring either for specific events or annually, and are employed to generate consumer interest. (Fig. 5-13)

Long time. It concerns a significant alteration in the physical appearance of a building. Such changes may occur due to a shift in the type of shop indicating a partial transformation as depicted in Fig. 5-14. Alternatively, the modifications may necessitate a complete demolition and reconstruction of the building due to a change in its intended use as observed in Fig. 5-15.

Moreover, Table 5-1 provides an overview of the relationship between the Specific Urban Attributes (SUA) and the target areas. Initially, the results show the presence of each SUA in the respective target areas, followed by the representation of the corresponding percentage based on the total analyzed numbers in each target area.

The analysis reveals that only two SUA are not observed in the Street Surface (SS) and Temporary Edge (TE). Among the remaining SUA, the percentage exceeds 40% for Closeness and Informal seating on the SS, while the range of 30% to 39% represents Informal seating in the Ephemeral Public Space (EPS) and Engagement in TE, revealing some specificities of these cases studies. Closeness in the EPS and Engagement on the SS fall within the range of 20% to 29%. Additionally, the EPS exhibits Guerrilla consumers, Engagement in TE, Smallness, Time ranging, and Customization equally, while in SS Blurry boundaries and Customization within the range of 10% to 19%. Lastly, the three target areas show almost all the SUA in less than 9%.

Table 5-1 Specific Urban Attributes and target areas

Specific Urban Attributes		Ephemeral Public Space (EPS)	Temporary Edge (TE)	Street Surface (SS)
Contrast	Closeness	2, 6, 14, 16, 19, 20, 33, 38, 43, 44, 46, 51, 55  13	21, 22, 32, 36, 49, 59, 71, 91, 93  9	1, 2, 4, 7, 11, 13, 21, 25, 27, 28, 29, 30, 31, 35, 38, 41, 42, 44, 45, 47  20
	Informal seating	8, 10, 11, 12, 16, 22, 23, 24, 27, 31, 32, 38, 41, 44, 46, 49, 54, 58  18	55, 72, 109, 120, 168, 174, 186, 188  8	1, 2*, 3*, 4*, 5*, 6*, 8*, 10*, 11*, 12*, 14*, 15*, 17, 17*, 18*, 19*, 21*, 22*, 23*, 26*, 28*, 29*, 30*, 30, 31*, 32*, 33*, 34*, 35*, 36*, 37*, 38*, 38, 40*, 41*, 42*  33
	Blurry boundaries	21, 23, 27  3	23, 25, 102, 107, 122, 155, 156, 160, 168, 193  10	16, 29, 35, 38, 39  5

	Time ranging	52, 53, 59 5, 21, 23, 48  7	16, 128  2	 0
Advanced Variation	Customization	1, 4, 7, 13, 17, 18, 37,  7	3, 37, 86, 172, 198  5	14, 19, 38, 41, 44  5
Partial Contrast	Indirect socialization	15, 34, 51  3	 0	1, 28, 38, 46  4
Legend		Notes -Numbers indicate EPS No. -Number represent the applicable out of 61 Ephemeral Public Spaces -Different SUA in same EPS are considered	Notes -Numbers indicate TE No. -Number represent the applicable out of 198 Temporary Edges -Only TE with pedestrians were considered -Different SUA in same TE are considered	Notes -Numbers indicate Building No. -Number represent the applicable out of 47 Buildings -Different SUA in same buildings are considered

According to the analysis of the predominant SUA in each target area, the research findings indicate that the slow pace and unevenness of Ura-Harajuku, through the EPS, as well as the length of Omotesando, through the SS, contribute to the promotion of informal seating. This indicates that despite the varying physical characteristics of these streets, pedestrians' tendency to sit can be enhanced in different settings and through different elements. Furthermore, the spatial depth in the TE of Shimokitazawa and the attractive content presence within a confined space are factors fostering engagement.

These clarifications enlighten the interactions of the coined terms of General Urban Attributes (GUA) to Specific Urban Attributes (SUA) in Fig. 5-16. Considering the society, space and time, these concepts evidence the contextual importance and resilience, thereby redefining how GUA contrasts, advances, varies, and expands in the physical environment of the street experience.

For instance, through the use of the EPS, TE, and SS, four SUA (Openness vs Closeness, Seating places vs Informal seating, Building boundaries vs Blurry boundaries, and Corporate-led redevelopment vs Guerrilla consumers) are found to completely contrast, suggesting that both GUA and SUA should be considered equally important in the planning or design of public spaces. On the other hand, four are variations from GUA to more concrete SUA, three of them (Friendly fronts plus Engagement, Proximity plus Smallness, and Impermanence plus Time ranging) involve expanding the concept to intake more examples from Tokyo's observations, and one (Spontaneity towards Customization) is more advanced. Only one interaction (Community vs Indirect socialization) is found in partial contrast.

These findings could indicate a variety of interactions in the Empirical Urban Attributes at Eye Level of commercial streets in Tokyo.

 Source: Author

5.3 Chapter Conclusion

This chapter examined the Empirical Urban Attributes, based on Tokyo's specificities, while establishing a correlation between the General Urban Attributes (GUA) and Specific Urban Attributes (SUA).

Chapter 5.2 discussed nine Specific Urban Attributes in Japanese commercial streets, considering the relation to the target areas analyzed in Chapters 2, 3, and 4, and enlighten interactions with the General Urban Attributes.

Finally, although a building could suffer significant changes, the street remains a constant feature. Hence, it is crucial to recognize the significance of the daily utilized built environment. Irrespective of whether a street is narrow or wide, small or grand, the street used as a place to stay plays a crucial role in defining the characteristic traits of a neighborhood.

CHAPTER 6 Conclusion

6. Conclusion

This chapter summarizes the arguments presented in previous chapters and concludes this research.

In **Chapter 1, “Introduction”**, the potential of the street as a place to stay was discussed. The chapter suggested a hypothetical framework that includes three factors to clarify the composite characteristics of the street as a public space experienced at Eye level in Tokyo. The characteristics that may be crucial for improving the human experience at Eye Level were denominated General Urban Attributes (GUA), and additional insights through some case studies analysis in Tokyo were denominated Specific Urban Attributes (SUA). Then, the research methodology, including the types of streets, the case studies, and the target areas, was explained. Moreover, the research relevancy and the thesis organization were stated to show the research’s significance.

In **Chapter 2, on “Ephemeral Public Space in Commercial Streets of Ura-Harajuku”**, the dynamism of ephemeral public space was analyzed through the observation of pedestrians making a pause for a short time along the street. The continuous frequency of these people stopping in the same space, arbitrarily, was analyzed. The results are summarized as follows:

- 1) In terms of the people’s grouping, posture, placement, and activities, combined results show a tendency of people to stand along the street, which enhances the dynamism of the street by stopping for a brief time. While a range of specific activities was observed, certain basic activities were consistently performed by pedestrians on both streets.
- 2) Regarding the characteristics of the EPS, a recurring pattern of people occupying spaces enclosed either on the sides or above was identified, irrespective of the day of the week.
- 3) The variety of emerging interactions, such as the allocation of EPS and the crowds appearing in neighboring Plinths are found as specific and common characteristics, suggesting a dynamism of streetscape with the pedestrians in both commercial streets.
- 4) For the unique character of the streets, on Harajuku Street, the movable and fixed seating provided by the shops, from a chair to a bench, offers a cozy and comfortable atmosphere to do shopping. Taking photographs, playing with a Gacha-Pon machine, making bubbles, giving samples as shop marketing campaigns, or queuing to buy bento boxes at lunchtime confirmed the ephemerality of this Megalopolis City.

In Chapter 3, on “Temporary Edge in Commercial Neighborhood of Shimokitazawa”, the characteristics of permeability of the Temporary Edge through the physical components and the pedestrians’ characteristics were investigated. The result shows a variety of permeability types in the streetscape of Shimokitazawa, where the buildings, streets, and people converge at eye level. The findings are summarized as follows:

- 1) The Temporary Edges featured openings, with over 60% being primarily composed of glass or completely open; a significant proportion lacked side enclosures, but most had eaves. Commercial equipment was present in over 80% of them.
- 2) Regarding pedestrian characteristics, most pedestrians tend to be in groups, and regardless of the day, the most common posture observed was standing. On weekends, a higher percentage of pedestrians were found inside and outside of the buildings, whereas on weekdays, more pedestrians were on the streets.
- 4) The results indicate that commercial buildings have some influence on pedestrian activities. Commercial activities were the most prevalent, but non-commercial activities were also observed.
- 5) An uneven distribution of permeability types within the Shimokitazawa commercial area was found, TEs with enclosed patterns with openings were observed from the outer areas towards the center. TEs, with more pedestrians, extended from the Station East exit to the eastern corner and from the center to the North and West sides.

The characteristics of the Temporary Edges observed in this study could encourage commercial activities to spread out onto the street, permeating the street life and enabling the use of the street as a public space for experiencing the ground floor closely.

In Chapter 4, on “Street Surface in Commercial Street of Omotesando”, the ephemerality of Omotesando was clarified through the composite factors of the Street Surface and its pedestrian characteristics. It confirmed the dynamism in a commercial street in Tokyo where the buildings, streets, and people converge at Eye Level. The results are summarized as follows:

- 1) In the physical components, the results showed low transparency using mainly glass windows, and the facade elements with the middle-term span change, such as showcase, are more common.
- 2) The outside spaces were allocated overall on the ground level enclosed and more than 2m wide.
- 3) The movable equipment types free of charge were the majority, while the sidewalk

tended to have fixed equipment types.

- 4) In the pedestrians' characteristics, small groups of single or couple, postures of standing or sitting were the majority.
- 5) For the activity patterns, mainly non-commercial were the most observed in every grouping and posture, mostly on the street side of the sidewalk, while commercial activities were predominantly in the OS.
- 6) In the ephemerality of the Street Surface, the intervals with the intense quantitative level of building facades appeared widely in the central area of the north or south sides. The distribution of pedestrians indicated similar conditions; in the west end, the enhanced groups of people were in the OS and on the sidewalk.
- 7) The representative scenes and the proportion of the SS patterns revealed more ephemeral is least frequent, and the majority is less or non-ephemeral. However, many places also had a medium quantitative level of SS components that implied a latent condition enhancing the ephemerality.

In Chapter 5, on “Empirical Urban Attributes at Eye Level of Commercial Streets in Tokyo”, from understanding the observed results in Chapters 2, 3, and 4, the nine Specific Urban Attributes (SUA) were described. The case studies shed light on the concept of the General Urban Attributes revealing a variety of interactions with the SUA. In particular, the nine SUA emerged as the different features of GUA, as contrast, expanded or advanced interactions in the physical environment of the street experience.

Moreover, the research outcome indicates that the slow pace and unevenness of the EPS in Ura-Harajuku, as well as the lengthy SS of Omotesando, contribute to the promotion of informal seating, while the spatial depth in the TE of Shimokitazawa and the attractive content presence within a confined space are factors fostering engagement.

From the above findings, this research clarified that commercial streets in Japan have distinctive characteristics that create a unique atmosphere to enhance the use of the street as a place to stay. Through different scales of streets and target areas, it was possible to grasp some of the variety of mechanisms that are used to attract pedestrians along the street. These dynamic relationships between buildings and pedestrians through frequent and short-time activities in Tokyo's commercial streets would suggest unique characteristics of the pedestrian experience at Eye Level. Further, these unveiled complexities among people and the building environment could be regarded as harmonious chaos in Tokyo, like a different type of hidden order.

Furthermore, in this contemporary era, several transformations have occurred and will continue to influence public spaces. Although it is important to learn from the previous examples, the capacity of quick adaptability is the most relevant for unforeseen changes. This research hopes to have shed light upon the different parts of the built environment in the commercial streets and serve as a precedent for studying the Empirical Urban Attributes that can foster vibrant commercial neighborhoods at Eye Level.

Future Studies

The findings of this research took an interest in other topics that may be beneficial and considered in the analysis of commercial streets and public spaces at Eye Level.

Same target area, different locations: The predominant tendency showed that the spatial depth of the Temporary Edge in Shimokitazawa and the attractive content presence within a confined space were factors fostering Engagement. Exploring the same target areas in other streets with similar characteristics could unveil new or parallel approaches, for instance, the commercial area of Yanaka or Shibuya. Furthermore, examining new target areas in other streets may shed light on distinct Specific Urban Attributes that could be incorporated.

Different locations, different target areas, same Specific Urban Attributes: In the case of Informal seating, the slow pace and unevenness of Ura-Harajuku, and the length of Omotesando indicated that despite the varying physical characteristics of these streets, the preference of pedestrians to sit can be fostered in different settings. Investigating diverse commercial streets, such as Ginza Area, could unveil the same Specific Urban Attributes, reinforcing the importance of this study.

Moving pedestrians: Pedestrians stopping along the street were the main focus of this research. However, additional investigations could incorporate an analysis of the origin of moving pedestrians and its consequential impact. For example, establishments such as ice cream shops that serve as attractions could draw pedestrians towards their location.

Pedestrian experience: Although this research aimed to analyze how people use cities in real life, further research could explore influential factors in user satisfaction and comfort in public spaces. Investigating the impact of aesthetics, sensory elements, and public space “amenities” on user experience could provide new strategies for public space design that cater to diverse needs and preferences.

Sustainable environments: In this era of climate change, future studies could focus on the environmental aspects of streets at Eye Level. Research could investigate sustainable design practices, green infrastructure, and the integration of nature within urban environments. In particular, the plant pots and street “beautification” through street space appropriation.

Technology use for methodology: Due to the increasing prevalence of new technology in our daily lives, future studies could explore the integration of technology in the research method at eye level. New software could analyze faster photographs taken during the fieldwork observation.

Timely transformations: In the study of commercial neighborhoods, the shops opening and closing times could be a factor that influences livability. Investigating these changes and transformations within a day could impact the analysis of the street as a place to stay. In particular, the neighborhoods mainly offering dining and bar options.

These topics provide a starting point for future studies in the realm of public spaces at eye level. The field offers numerous opportunities for research, encompassing various factors that could be included.

Date

Ephemeral Public Space No. 01

Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
On more than one side	No eaves	Seating 	Q3

NOTE:
When the door is open, it created a space that attracted people even with or without chairs.

Date

Ephemeral Public Space No. 02

Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
On more than one side	No eaves	Vending machine Standing sign 	Q3

NOTE:
The standing sign is perpendicular to the street which prevents people and cars from go straight freely

Ephemeral Public Space No. 03

Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
On one side	No eaves	X	Q3

NOTE:

Ephemeral Public Space No. 04			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
On more than one side	with eaves	Seating 	Q1
NOTE: Although the bench is in front of a shoe shop, not only clients but people passing by stop to sit there.			

Ephemeral Public Space No. 05			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
On more than one side	with eaves	Gacha-Pon Standing sign  	Q1
NOTE: This space has a little slope to the street so it is not easy to stand or stay longer unless there is a specific reason. In this case, the Gacha-Pon machine used during golden week drag the attention of customers			

Ephemeral Public Space No. 06			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
On one side	No eaves	X	Q3
NOTE: The fact that the shop is not accessible from the side makes it more attractive for people to stop.			

Ephemeral Public Space No. 07			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q4
Not surrounded	No eaves	Seating 	

NOTE:
The bench belongs to the restaurant, which is only open during meals time after March it was taken away but the corner is still attractive to people.

Ephemeral Public Space No. 08			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q1
On more than one side	Eaves	X	

NOTE:
This space is used only during weekends because there are fewer people going inside the building.

Ephemeral Public Space No. 09			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On more than one side	No eaves	X	

NOTE:

Ephemeral Public Space No. 10			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On more than one side	No eaves	Standing sign Handrail	
NOTE:			

Ephemeral Public Space No. 11			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q4
Not surrounded	No eaves	X	
NOTE: The proximity to the convenience store made this place a regular use for pedestrians			

Ephemeral Public Space No. 12			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On more than one side	No eaves	Vending machine Handrail Bollards	
NOTE: This space has shadow most of the time. People come for buying in the vending machine and stay a while.			

Ephemeral Public Space No. 13			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q1
On more than one side	With eaves	Seating Handrail 	

NOTE:
This shop most of the time has music playing but not so many people were found sitting in the furniture provided.

Ephemeral Public Space No. 14			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On one side	No eaves	X	

NOTE:
Depending on the advertisements types, which changed constantly people stared or stayed longer, taking pictures with them, of them or just checking out dates.

Ephemeral Public Space No. 15			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q1
On more than one side	With eaves	Outdoor ashtray Screen 	

NOTE:
This space is designated for smoking and it is one of the most popular in the whole street.
People gather at any time of the day.

Ephemeral Public Space No. 16			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On one side	No eaves	X	

NOTE:
Even if there is no big area for staying, most of the people bought something from the convenience store and enjoyed it outside.

Ephemeral Public Space No. 17			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On more than one side	No eaves	Seating 	

NOTE:
This bench is very appealing because it is just in the middle of the street with a perfect view to the endings.

Ephemeral Public Space No. 18			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q1
On one side	With eaves	Seating 	

NOTE:

Ephemeral Public Space No. 19			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On one side	No eaves	Traffic cones Post 	

NOTE:
The fact that the hospital doesn't have any pedestrian access on this street makes people stop outside even if space is narrow

Ephemeral Public Space No. 20			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On one side	No eaves	X	

NOTE:

Ephemeral Public Space No. 21			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	Q3
On one side	No eaves	Standing sign Handrail 	

NOTE:
This Space is enhanced by giving samples from the coffee shop inside, but Encounters were found including when there are not giving it away.

Ephemeral Public Space No. 22			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
Not surrounded	No eaves	X	Q4

NOTE:
The setback of the building gives a variety of places to stay.

Ephemeral Public Space No. 23			
Enclosure		Versatility	Pattern
Vertical	Horizontal	◇	
On more than one side	No eaves	Planter	Q3
